that relates to the city, they were certain to make their sketch pleasing, and as far as possible truthful. In illustrations they have had advantages which were denied to earlier historians. Modern processes enable old views to be reproduced, which become more eloquent about the past than any description in words. The frontispiece, for example, shows London Bridge and the Tower as they appeared to the eyes of CHARLES, Duke of Orleans, about A.D. 1500. We see the prince in one of the rooms engaged in writing, while the number of guards in the background indicate that he was a prisoner. He is shown also looking out of one of the windows and receiving a visitor, probably an English prince. The turrets have finials which bear coats of arms. London Bridge is in mid-distance, with the houses on the roadway and the waters rushing violently through the arches. In the background, which extends to Westminster, many church towers rise up. In the mind of the French artist, London was evidently a great city. A coloured drawing of a tournament from the "Romance of Sire Jehan de Saintré" suggests one class of spectacles which were occasionally witnessed in Cheapside. Bow Church still has its royal gallery, although knights in armour are never likely to break spears in front of it. A picture of RICHARD II. recalls passages which FROISSART recorded. The king, dressed as richly as any modern herald, is passing through a gateway surrounded by knights in black armour, on his way to war with the half-naked rebels in Ireland. The unlucky king delivered by BOLINGBROKE to the citizens of London, who show no reverence for fallen Majesty, is the subject of the next picture. In this illumination another of London's gateways is introduced. Then we see the funeral of the king, who was first buried in King's Langley, and subsequently in Westminster Abbey. But even more interesting in a topographical sense are the reproductions of drawings by ANTONIE VAN DEN WYNGAERDE, which are now in the Bodleian Library, and which were probably made for PHILIP II before 1561. In them are shown Westminster Abbey and the Eleanor Cross at the end of the Strand. The dwellers in the Strand could enjoy at the time a background of fields. St. Paul's Cathedral then, as now, dominated the city, but a lofty tower and steeple took the place of the present dome. London was so crowded with houses that we can hardly detect any signs of the streets. We have a view of Greenwich and of the distant city taken from the Observatory Hill. The copies of the Flemish artist's drawings are valuable evidence, and deserve to be prized. In addition are several reproductions of the drawings of J. WYKEHAM ARCHER. He was a Newcastle engraver, but he had the soul of a true antiquarian, and vestiges of old London he held in a peculiar admiration. Between 1830 and 1864 he made many drawings, which are now in the British Museum, and fill no less than seventeen portfolios. A selection of them will be found in the volume, and as several of the subjects represented have been demolished or transformed, the interest of the drawings will be increased as time passes.

In Mediæval London there were two centres, St. Paul's and Cheapside, corresponding with the spiritual and material necessities of the inhabitants. Of the disposition of the space between them the authors give the following sketch:

The Bishop lived on the north side of the cathedral; his palace and gardens extended back to Paternoster Row; the chapter-house and the cloisters round it lay on the south side of the nave; fragments of it may be seen to this day. Adjoining the S-W. wall of the nave was the church of St. Gregory-by-St. Paul. The parish still exists. In that church the body of St. Edmund, king and martyr, lay for some years before it was buried at the town which bears his name. On the east side of the churchyard was a large grass-grown space, just such a spot as we still see so constantly on the borders of country towns and villages—the "village green," in fact. Across it came the great Roman road, which started from London Stone, passed along what we now call Newgate Street, and went away to Che-hire, following, as we may say, the course of the N-W. Railway. This after Roman times received the name of Watling Street, i.e. "Atheling Street" (= High Street). It does not, indeed, as far as the city is concerned, answer to the present Watling Street, for after leaving what we call Budge Row, which was part of it, it went straight on over ground which is now covered

* *Mediæval London.* By William Benham, D.D., F.S.A., and Charles Welch, F.S.A. London: Seeley & Co., Ltd.

with the streets south of Cheapside. It became necessary later on to change its course, owing to difficulties connected with the enlargement of St. Paul's Churchyard, and the new Watling Street is the substitute. But to return to the "Green by St. Paul's." This, after Norman times, was the site of the Folk-mote, of which the present "Common Council" are the elected representatives. The citizens met on this green in the open air, seats being plentifully dispersed about, and here the public business of the city was carried on. Nor must we omit mention of "Paul's Cross," at the east corner of the north transept of the cathedral, the site of which was discovered by Mr. Penrose, and is now marked by an inscription on the ground. At the east end of the green there was a short, narrow street, passing through which you came (just where is the fine plane-tree) into Cheapside. But it will tax the imagination of the reader considerably to realise how different was this locality from that which bears the same name to-day. "Side" means "place" or "part." Cheapside means, therefore, "Market-place." It was as much the London market-place as that of any provincial town of to-day. It was a large square, reaching back as far as the present Honey Lane and other streets in a straight line with it, and with booth-decked streets branching away as far as the Guildhall and Basing Hall.

It is shown that the Cistercian movement exercised extraordinary influence in London. GILBERT BECKET of Cheapside was affected by it, and his son THOMAS also. The works at the cathedral were then taken up with energy. RAHERE, the minstrel, became creator of the Priory of St. Bartholomew. In Aldgate another priory was founded. London previous to the Reformation, if gauged by the number of religious houses, might be considered as a religious city, and the Flemish artist was not using his imagination or working at random when he introduced a large number of church towers in his drawings.

A chapter is devoted to the civic rule which has done so much for London. The trade guilds are stated to have been originally the union of "neighbours who met together for the purpose of good-fellowship and for association in religious duties." It was in the reign of EDWARD III. they were transformed into crafts and mysteries. An Act was passed in 1364 which enjoined all artificers to choose a mystery and to use no other. The election of officers was a curious affair, for we are told that "the retiring masters and wardens entered with garlands on their heads, preceded by the beadle and the minstrels playing. Then the garlands were taken off, and after a little show of trying whose heads among the assistants the said garlands best fitted, it was found by a remarkable coincidence that the persons previously chosen were the right wearers." A similar course was, we believe, adopted for more important duties. The book includes chapters on the Thames and on the religious life of London. In the latter there is a reference to the residence of the Archbishop of Canterbury at Lambeth. It may not be generally known that the buildings up to the nineteenth century were called Lambeth House or Lambeth Manor, not Lambeth Palace. It is also worth noting that the "Lollards Tower" is a misnomer; the inscriptions on the walls are assumed to have been written by prisoners during the Puritan wars, for the building which bore that title and with which the Lollards were acquainted was at St. Paul's. It would have been easy for the authors to have devoted several large volumes to an account of Mediæval London. But the present "Comprehensive Survey" contains as much information as ordinary citizens are likely to require. The various parts are well arranged, and the impression produced by the pages is that, with all their shortcomings, the old citizens were worthy men, and many of them discharged difficult and dangerous duties in an honourable manner. The latest book on the history of the city deserves to be popular with all classes, from the Lord Mayor to the youngest apprentice.

A Testimonial is to be presented to Mr. Thomas Fairbairn in recognition of his long service as honorary secretary to the Edinburgh Architectural Association, and subscriptions for same are invited.

The Next Meeting of the Civil and Mechanical Engineers' Society will be held on Thursday, December 5, at 8 P.M., at St. Ermin's Hotel, Caxton Street, near St. James's Park station, Westminster, when a paper will be read by Mr. J. Bridges-Lee, M.A., on "The Geometric Interpretation of Photographs as applied to Photographic Surveying."

STAINED GLASS IN ENGLAND SINCE THE GOTHIC REVIVAL.

INCLUDING SOME ACCOUNT OF ECCLESIOLOGICAL PROGRESS, FROM 1860 TO THE PRESENT TIME.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays among The Glories of France," &c.

(Continued from page 315.)

IF not presenting that imposing assemblage of parts possessed by St. Columba's and St. Chad's churches, that of St. Saviour, Hoxton, is perhaps quite as remarkable from the manner in which the architect adapted it to a somewhat restricted site at the junction of Penn Street and Northmore Street, near the Rosemary Branch Bridge of the London Canal. Red and yellow brick sparingly dressed with stone is the external material, while inside the walls are of red brick only. The First Pointed style in which St. Saviour's is built has a somewhat Italian caste, but in external appearance it calls to mind certain of those spacious town churches built by the Preaching Orders in the Low Countries. The site of this church precluded its being very long, but it was necessary from its breadth and from the juxtaposition of houses to its west and south sides that it should be lofty. There is, however, a good space to the north-east of St. Saviour's whence the best general view of it can be obtained, and from which one can appreciate the skill with which Mr. Brooks contrived to avoid any unpleasantness that might have been produced by disparity of dimension. This was effected not only by the roofing, which with its red-tiled ridge crest is only broken by a simple but pleasingly contoured *fleche* denoting the separation between nave and chancel, but by the broad lean-to aisles which extend from end to end, a small outgabling sacristy at the eastern extremity of the northern one breaking up the monotony very pleasingly, but without interrupting the continuity of line. The simple semicircular apse is a fine feature in this view of St. Saviour's, and although its employment must have reduced the size of the sanctuary, it certainly does much towards taking off from that truncated appearance which great height and inconsiderable length invariably present. Seventy-five feet high to the roof ridge, this apsidal east end of St. Saviour's, Hoxton, tells to great advantage, viewed both from near and far. It is worthy of remark that Mr. Brooks, when not terminating his churches rectangularly, always used the true semicircular apsis, and never that hexagonal form of it which, so frequently employed by his contemporaries, does not appear to have been a favourite in England during any age of Pointed.

At a first glance the only apparent distinction between the nave and chancel is effected at St. Saviour's by the spirelet, but a more careful notice will show that this has been quietly but decidedly accomplished by the fenestration of the clerestory. To that of the chancel and apse there are thirteen tall narrow lancets, the nave being lighted by windows of the same kind, alternating with a couple of shorter ones surmounted by a foliated circle. Thoroughly brick in its construction, such an unbroken series of windows is another feature that has no inconsiderable share in giving the church an air of much greater length than it really possesses.

Interiorly we find the same end accomplished by the omission of the chancel arch, and by the prolongation of the string-course below the clerestory completely round the church without any break, the distinction between nave and chancel being emphasised by the roof, which in the former has a close succession of semicircular ribs with tie-beams, and in the latter is ceiled. Five arches compose the arcade, which is formed of two orders—the inner one of stone, the outer of red brick; but from the absence of dripstones an air of weakness is imparted to the whole, besides which some break seems needed between the outer order and the walling, which is of the same material—red brick unrelieved either by stone bands or by patterns in black or white. The columns are octofoiled in section with conventionally foliated capitals, the fourth on either hand being raised upon a plinth commensurate in height with the base of the screen at the entrance of the chancel, which is formed within this last bay.

St. Saviour's is rich in decoration, both mural and vitreous. The frescoes filling the six shallow arcades relieving the apse wall below the windows—three on either side the reredos—are by Mr. N. H. J. Westlake, their gold grounds and brilliant tones striking a note of rich colour and harmonising with the surrounding architecture. The reredos, composed of three stilted arcades surmounted by four circles and contained beneath an arch and straight-sided gable, is flanked by pinnacled buttresses somewhat in the school of Butterfield. The circles contain sculptured half figures of angels, and the arcades one subject, that of the Ascension, upon a background of colour.

Of the thirteen lancets lighting the apse, five have received stained glass. The figure of Our Lord standing with an open book in the central one was inserted shortly after the completion of the church in 1865. Crimson and brown are the prevailing tinctures, the canopywork being treated by Messrs. Clayton & Bell in the conventional style employed by those artists at that period. With this glass Messrs. Lavers & Westlake's in the two windows on either side compares most favourably.

Here we have effigies of the Evangelists, into which just the right amount of naturalism, consonant with their situation, is imported, the greenish-white of the quarries, quite free from canopy or other accessory work, forming a striking contrast to the rich tinctures of the figures themselves, and while a sufficiency of colour is obtained, grateful to the eye, little or no light is excluded. So successful are these windows that it is to be hoped the completion of the remainder in the same style will be entrusted to the same hands. Hardly so successful is the work of Messrs. Lavers & Westlake at the west end of the church, where, 60 feet from the ground, is a plate-traceried rose, and below it, at a distance of 40 feet from the ground, a couple of windows, each formed of two lancets surmounted by a foliated circle, all within a containing arch of brick. At present the rose which constitutes such a fine feature of the west front, viewed externally at a little distance, remains plain. The two windows below it have stained glass—partly a memorial to a former vicar, Rev. John Oakley, Dean of Carlisle 1881-84, and of Manchester 1884-90—comprising groups which, while exhibiting good draughtsmanship and refinement of tincture, are too large for the lights, the result in certain portions being rather confusing. For windows of this description and at such a distance from the eye, it would have been better had a more archaic treatment been pursued, this being a case in which great clearness was desirable, the very excellent work of Messrs. Clayton & Bell in the aisles being in some measure taken as a guide.

MANCHESTER SOCIETY OF ARCHITECTS.

THE annual dinner of the Manchester Society of Architects was held at the Queen's Hotel on the 21st inst. The president (Mr. Alfred Darbyshire) took the chair.

Mr. Darbyshire, in proposing "The Royal Institute of British Architects," referred to the Liverpool Cathedral scheme so far as it concerned Mr. William Emerson, the president of the Royal Institute. Fourteen or fifteen years ago there was a general competition for designs for that cathedral, and the adjudicator, after taking twelve months to make his award, selected Mr. Emerson's designs as the best. Since then it had been decided to build on another site, and that the design must be Gothic, but on representations from several people, the war as to style had been removed, and now members of the profession were asked to send in portfolio drawings for a cathedral. Where was the President of the Institute in all this? It was one of the most regrettable instances of the whole business that Mr. Emerson was not going to compete again. The man who had first been selected as the right man to undertake the work would now retire into oblivion, and the work would be left to men who came fourteen or fifteen years after him—a change so extraordinary in the development of their art that they could not be surprised at anything else that might happen.

Mr. William Emerson, in reply, said he could only hope, for his own sake, that the chairman might be mistaken in supposing that he was going to retire into oblivion. With regard to the art of architecture, he had seen something in the newspapers with regard to this Liverpool building, which included the expression of a hope that the genius of the country might produce a building in the new style, and that such a building

would be received with acclamation. He could not help thinking that such remarks were calculated to do an enormous amount of harm and cause deterioration in the architect's profession, and for this reason, that there was a considerable striving after originality at the present time. He had recently seen a work by a gentleman who had a considerable following among younger men in which the principal *motif* was columns of about 15 or 16 diameters high—the sort of proportion which those accustomed to the best class of work did not really understand. He could not help thinking that instead of diverging from known principles of proportion, unless one could prove that the proportions and principles were better, one had best stick to old ones. Then, again, there was another school affecting what they termed *l'art nouveau*. He saw some examples of that school in a town a few miles north some few weeks ago, and the impression made on him was that there was entire ignorance of all that had gone before, that known rules of construction had been wilfully ignored, and that there had been a purposed going out of the way to make eccentric detail. He did not think that could be called high-class art. It seemed to him that one could not do better than start with a masterful knowledge of precedent and the best of old work, and then design to meet modern requirements, showing one's own individuality in the details.

Mr. E. Salomons gave "The Corporation of Manchester," and expressed regret that the Manchester improvement committee was simply an improvement committee and not an originating committee. He contrasted the barrenness of Manchester's record for the last fifty years with the achievements of continental cities in constructing fine, tree-bordered boulevards in the centre of the city; and subsequently he referred in terms of satisfaction to the fact that it was on the *tapis* to appoint a city architect who should be something more than a city surveyor or a city engineer.

The Lord Mayor, in his reply, differed from Mr. Salomons as to the appointment of a city architect. He submitted that it was much better for Manchester that the competition for public buildings should be open, and he expressed the opinion that it would be a loss to the community if all the public buildings were to be of one stamp.

Mr. P. S. Worthington gave "The Victoria University and the Owens College."

Mr. Alfred Hopkinson replied, and, speaking of the Owens College, he said that the College was gaining more and more the hearty support of the commercial, industrial and professional community. There was no profession with which they desired more close association than with the architect's profession. At the College an endeavour was being made to adapt young men to the practical side of life just as in the profession of architecture buildings were being adapted for the practical purposes for which they were required. He offered in this connection one word against an old heresy—the mere idea that adaptation to practical purposes would necessarily produce beauty. The most hideous object of the day was the bicycle scorch. Was he not adapted to his purpose? Did he not put himself into a position to offer the least resistance to the wind and did he not devote himself wholly to the purpose of getting quickly over the ground? One never saw an "object" of that kind without thinking how hideous he was, and that one would like to show him that it was possible to get over the ground just as fast without that offence against the laws of deportment.

Other toasts were "The Manchester Society of Architects," given by Professor Tout; "The honorary legal adviser," acknowledged by Mr. W. Goldthorpe; and "The hon secretary," acknowledged by Mr. P. Ogden.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE Council of the Edinburgh Architectural Association have had under discussion the designs of the proposed new buildings at the Castle, recently exhibited in the City Chambers. After having inspected the plans, the site and the probable effect from various points of view, and having fully considered the question, they resolved as follows:—"The Council desires to express its sense of the courtesy of the War Office in giving the citizens an opportunity of seeing and discussing what is proposed to be erected on a site so unique in position as Edinburgh Castle. The Council feels most strongly that a site of its commanding position demands the most careful and skilful consideration, and although it is evident that no little attention has been directed to the preparation of the designs, the Council observes with great regret that from any point of view the outline of the great mass of the Castle and its buildings will be disfigured; and, further, that the general designs do not commend themselves as being in harmony with the better work on the Castle Rock. The Council trusts that, as this question is one of very great and permanent importance, nothing will be done without further serious consideration."

CATHEDRAL STREET, No. 372A.—CHICHESTER: ABOVE LIBRARY ON TRIFORIUM LEVEL.

CATHEDRAL SERIES NO 3723.—CHICHESTER: DOORWAY IN S.W. TOWER

NOTES AND COMMENTS.

THE London County Council have been persistent in denying that in the enormous works which they have undertaken any malpractices were connived at. The Council were all honourable men, and their employés of all ranks were no less distinguished for rectitude in business. We have, from time to time pointed out instances which made the official conviction appear dubious. It cannot any longer be concealed that the system on which works are carried out is a disgrace to the whole Council. The statement of the *Times* correspondent about the County Council bricklayers restricting themselves to laying 330 bricks a day, which is not one-half the normal quantity, was confirmed at the meeting on Tuesday. The chairman of the finance committee could only say there was no official sanction of that limit. We are afraid a great many other misdeeds are occurring of which official sanction is not recorded in the books of the Council. The sub-committee entrusted with the investigation of the subject admit that there had of recent years been a diminution in the amount of work done by the bricklayers, but that recently there had been an improvement. But the value of the "improvement" will be manifest when it is said that the sub-committee were unable to state in any specific form what the production had been and what had been the increase of late. The worst part, however, of the affair, is that the sub-committee of the Council do not say one word about the dismissal of the men who have not been doing a fair day's work for their very liberal wages. The Council dare not turn them out, for the members hold their office through the votes of workmen and of others who resemble them in holding peculiar ethical doctrines. As long, however, as the great body of the ratepayers of the Metropolis remains indifferent to the elections of the County Council it must be expected that works will be conducted on a system that is ruinous to those who have to bear the expense.

To many students of the history of architecture the PERROT-CHIEPIEZ partnership for the production of volumes on the history of art appeared to be as indissoluble as that of ERCKMANN-CHATRAIN in romance. In the latter case prosperity broke the bond, and we regret to say that owing to the death of CHARLES CHIEPIEZ his co-operation is no longer possible, and M. GEORGES PERROT will have to continue the series relating to the history of art in antiquity without the aid of the friend through whose knowledge the volumes possessed a distinct character. Already volumes have appeared on art in ancient Egypt, in Chaldea and Assyria, in Persia, in Phrygia, Lydia, Caria and Lycia, and in Greece. What is remarkable in them is that the importance of architecture in all those regions is demonstrated, whilst in most other histories sculpture or painting is made dominant. It is to the credit of M. PERROT that when he projected the series he was able to realise the position of architecture, and therefore sought the aid of CHARLES CHIEPIEZ, who was competent to treat the subject with the definiteness which was to be expected from a professional architect. CHARLES CHIEPIEZ was born in 1835. Although he was the son of an architect he did not find clients awaiting him, and he was obliged to utilise his abilities in teaching the arts of design. M. TRÉLAT engaged him for his architectural school in the Boulevard Mont Parnasse. The buildings he was enabled to carry out were very few, but between professional and literary tasks his time was fully employed. His reputation as an authority was not confined to France, for when the directors of the Metropolitan Museum of New York wished to possess restorations of the Parthenon and the Pantheon for the instruction of visitors, the work was entrusted to CHARLES CHIEPIEZ. He had also made large models of other ancient buildings. All who have read the volumes which bear his name must hope that he left manuscripts which will enable the series to be completed on the original plan.

THE object of the United States Government in imposing a high duty on imported goods was, of course, to promote native production. There was no reason why

native art should not be reckoned as an industry and helped in every legitimate way. The Customs officers may be as useful aids as any other class of non-purchasers. But in carrying out regulations which seem to be restrictions on the enriching of America with paintings and sculpture by foreign artists, much has to be said and done which appears to denote indifference to art. That the Customs authorities are not, however, narrow-minded has been shown by a recent incident. An American gentleman who had obtained a bas-relief which was said to be a work by MINO DA FIESOLE, was annoyed when he heard it was detained at the Custom House as an example of "manufactured marble." As such the duty on it was 50 per cent. of the value, but a work of art can gain admittance by paying 20 per cent. An appeal was accordingly made to the higher officials, and no difficulty was experienced in effecting the change. Now some people may be amused because a Customs officer imagined that MINO was a modern instead of a fifteenth-century sculptor, but it is not to be expected that civil servants should be able to pass an examination in the history of art. The readiness with which the error was corrected and a reduced duty accepted speak well for the liberality of the Americans. If a case of the kind arose in England, we are afraid our Customs officers would insist on some way by which the heavy duty would continue to be exacted.

THE Corporation of London have regulations respecting lamps and clocks. Both are to be licensed and annual fees paid for them. A lamp, for instance, other than a French lamp is not within the City to exceed 4 feet in height and 2 feet 3 inches measured sideways, nor is it to project more than 4 feet 6 inches from the front of a house. The regulation has been about two years in operation and does not appear to have caused much inconvenience. The London County Council also propose to issue by-laws for the regulation of lamps, signs or other structures overhanging the public way. A special committee of manufacturers and traders have been dealing with the subject, and they have come to this conclusion, "that the by-laws as drafted would injuriously affect the great bulk of traders within the County of London (and several industries concerned in the supply of lamps, signs and other accessories) coming within the scope of the by-laws. The traders concerned are large contributors to the rates, and resent the interference thus contemplated in the free prosecution of their business. They object absolutely in principle to the provisions in the said by-laws involving the special "sanction" of the local authority in matters of everyday necessity and established custom in trading communities, except so far as may be necessary for the public safety. Moreover, the by-laws are an innovation, and if applied retrospectively without amendment will cause immediate inconvenience, expense, and even loss, to many traders in whose businesses outside lamps, signs and similar structures are useful adjuncts alike to them and to the public generally." As well as we can judge from the words, the objectors are more dissatisfied with the novelty of regulations than with any of the enactments. It should be remembered by them that pavements are to some extent owned by the public, who should be protected while using them. It is true that if a lamp or a signboard falls on anyone passing and injury arises, damages can be claimed. Hanging signboards can sometimes become picturesque additions to a house, but those who are most desirous for their revival realise the necessity of enactments which will insure the public safety.

THE GREAT CENTRAL HOTEL: THE DINING-ROOM. THE STAIRCASE.

SOCIETY OF ARCHITECTS.

THE opening meeting of the session of the Society of Architects was held last night, when the president, Mr. Silvanus Trevail, mayor of Truro, delivered the inaugural address.

The President began by thanking the members for the unanimous voting for his election. He congratulated them on the success of the Society, to which Mr. Ellis Marsland as honorary secretary, Mr. Quartermain as treasurer, and Mr. M'Arthur Butler as secretary, had contributed. The Society was to be regarded as having been primarily formed to look after the business side of the profession, whilst not ignoring the educational, the scientific, or the artistic. The President then said:—

It is to this business side or aspect of our Society that I purpose to address myself mainly to-night, as being what I conceive to be more in accord with the wishes of my professional brethren, especially those in the provinces, who suffer in a greater degree than do those in the Metropolis and larger provincial cities from the neglect of the central architectural bodies in taking up practical matters that affect the everyday life of the provincial practitioner.

In London and in the larger centres, the position of an architect is better defined and understood; his qualifications, his executed works and his professional status are recognised. In smaller places these points do not appear to have the same weight, and in too many instances the qualified architect stands simply on a parity in the public mind with another calling himself by the same name, regardless of the relative qualifications of the two men, and particularly so if the charlatan offers to do the job at an inclusive fee that may on the face of it appear to be much below the recognised professional rate.

Instances of wholesale plagiarism and abuse of the term "architect" come almost daily under the observation of country practitioners, that would simply be regarded as incredible and could have no existence in our larger centres through the different conditions that obtain there.

I regret to say that, from various examples that have been brought to my notice, the local district surveyor's office in small provincial towns is frequently made the medium for plagiarism of the most impudent description. Plans and sections of new buildings have to be deposited in accordance with the provisions of the local by-laws. The local council, acting upon the recommendation of their surveyor, issue a notice to the effect that these must be in duplicate, one set to be retained by the authority and the other for stamping and return. But latterly elevations as well as plans and sections have been required, with the result that complete sets of drawings, minus the details, are in the archives of the surveyor and his batch of assistants, so that they have a complete record of all the work done in that particular town or district.

Soon we see the effect. Mr. A. builds a residence in the locality from designs furnished by a London or other distant architect of recognised standing. Afterwards Mr. B. wants a house, and likes the style of Mr. A's residence. It is known locally Mr. B. is about to build, when he is visited by either the local surveyor or some member of his staff with the plausible intimation that if Mr. B. wants a residence like Mr. A's, everything can be done for him in the "office" much more expeditiously and better than can be the case from a distance, at a cheaper rate, and with the certainty of the plans passing the authority without revision or delay. The result, of course, being that the surveyor or his assistant gets the instruction to proceed, and forthwith does so by providing himself with the necessary sheets of tracing paper or linen, copying the deposited plans in his possession, after making such trifling modifications as the altered conditions of the site or other requirements may necessitate.

Of course, I am aware that such a state of things could not for a moment exist in the Metropolis or in our larger municipalities, where district surveyors have something else to do and would scorn such practices; but they do exist to an extraordinary extent in our smaller ones, and scarcely a week passes but complaint comes from one architect or another of abuses of this sort, and so much so that I have been requested to call attention to the matter in this address.

Possibly the greater men in the profession do not suffer to the same extent as the smaller ones, because their work is usually not of what may be deemed the ordinary character. Still they do suffer, and to a far greater extent than they are conscious of. But seeing that all cannot be engaged upon large and extraordinary works, and that the average practitioner has to live by what is mostly in demand around him, and that it is the status and well-being of these that this Society wishes particularly to protect, it appears to me that here is a subject that may well demand its attention.

All local surveyors and their assistants should be debarred from practice as "architects" as a condition of their appointment, at any rate, within the areas over which they have adjudicatory powers. Such an abuse as I have outlined would be tolerated in no other profession, and the model by-laws of

the Local Government Board were never intended as an instrument for the fostering of any such contemptible practices.

But the class I have mentioned have some knowledge of architectural work, and certainly of drainage and sanitary matters, and, with this, possibly greater excuse for "dabbling" than other examples that have come under my notice, where board schoolmasters, builders' clerks, auctioneers, land agents, general contractors, clerks of works, boys from the nearest art school, photographers, highway surveyors, and in one instance a marine-store dealer, have signed themselves as "architects," and submitted plans to local authorities, and otherwise acted as professional advisers to their clients. With such absurdly unpractical drawings as is the natural product from such sources, something generally happens either during the progress of the building or afterwards, when the fault is of course the "architect's," and our profession as a body gets stigmatised for the monstrosity created or the melée in the law court, when any recognised member of it has had about as much to do with the unsatisfactory business as the "man in the moon."

This naturally brings me to the subject of registration—the statutory registration of the architectural profession—which was one of the main objects for which this Society was established, and which still remains the cardinal article of its faith. In fact, those who are carefully watching the progress of events, both at home and abroad, see that there is greater necessity than ever for registration to-day, and that almost every civilised state worthy of the name has adopted the principle in some shape or form. So much is this in evidence that this country will not be able to hold back much longer.

In certain quarters there has been some fear that qualification by special training and examination, with compulsory registration following, would be productive of a low average mediocrity, and might prevent the artistic genius from ever entering the profession. This I consider to be a great slight upon men of genius and real power. It would do nothing of the sort. It would raise the general standard of efficiency and the general status of the profession, and real genius would have quite as good opportunities of coming to the front, if not better, than it has to-day.

From registration I will turn to another subject that the Society has taken up, in the belief that it would be of public as well as professional advantage. I refer to that much-vexed question of "ancient lights." Who amongst us when starting a building in a town has not been threatened at the very outset with an injunction, frequently upon the most flimsy grounds that could only be described as an excuse for an attempt to levy blackmail upon one who, having the money to build, is supposed to be good game to be plucked for fanciful damages and costs?

In one of such instances, where I happened to be the architect for the new building, we pushed our building back by 3 feet, but went 3 feet 6 inches higher than the old one that previously stood on the same site. But although there was a space of something like 30 feet between the two buildings that had been increased by 3 feet, we were sued by our neighbour opposite for damages to his lights. After close upon six months' preparation of the case on both sides, with a whole crowd of witnesses, expert and otherwise, and five days' waiting at the Law Courts in London to all of them for the termination of the case that was in front of ours, the hearing came off and occupied another couple of days. You will all of you have a pretty keen appreciation of how the costs were mounting up by this time. But the end of it all was that no damage could be proved against any of the windows on the ground, first or second floors, but that there was one little tiny window of the basement just peeping above the pavement level, measuring in all 84 square inches of glass area, that the learned judge thought might possibly have suffered an infinitesimal diminution of light, because we had gone 3 feet 6 inches higher than the previous building, although we had gone backwards 3 feet. For this he awarded the sum of 50*l.* damages, and this carried the costs against the building owners, which amounted to over 900*l.*, although in delivering judgment his lordship characterised it as one of the most trumpety cases that had ever been brought before him, and that it ought never to have been taken into court. So much for the law, which was perhaps technically right, but how about the justice? and what inducement was there after this for other property owners to improve their properties with such risks as these staring them in the face? My experience has since been that when an owner smells a claim of this sort as likely to arise, he at once cancels his instructions, buttons up his pockets, and allows matters to remain just as they were, to the detriment of the locality, the ratepayers, the architect and the property itself. I have many such postponements now in a pigeon-hole, as I dare say have other practising architects, where elaborate schemes have been carefully prepared that would be of the greatest possible benefit to the locality and to individuals, but are stopped because of the uncertainty and expense of what might happen if the work was commenced.

Now, what we as architects require, and what the British

public wants, is a preliminary court of appeal in each locality, where plans can be deposited when any improvement is contemplated likely at all to affect others. Those who may adjoin should have notice of what was intended, and the full right of inspection of plans and the pros and cons should then be gone into fully, and if in the opinion of the court damage was likely to be sustained, they might say so with or without assessing it, as might be agreed to on both sides, but at any rate to have the power of giving a permit for proceeding with the work if the damage in their opinion was not such as to materially affect the user of the complainant's premises, when the subject of actual damage sustained could be subsequently ascertained by arbitration or in the law court in the usual way. This at any rate would release properties from the state of absolute block that many are in to-day, and I always maintain that the public as a body and architects as a body are interested in motion and improvement rather than in stagnation, though in certain cases big fees may be obtainable for assisting to create a state of stagnation.

There are other subjects of an essentially practical character that the Society might fairly express its opinions upon. I was not long since accosted in the street by a gentleman who, as a member of many building committees, has had a great deal to do with different architects, and he told me that he was astonished to find such a great variation as existed among architects as to what services should be rendered for the ordinary commission of 5 per cent. He remarked that if there was a clear and definite statement upon the matter it would be of great advantage to the profession as well as to the public, and be a means of securing uniformity of practice. Now, I take it that we as a body do not want to be told what is included in our ordinary fee of 5 per cent., but as there are others outside who would like to know, and seeing that anything that will conduce to uniformity of practice is a distinct advantage, I will take upon myself to define the duties concisely as follows, as coming within the ordinary commission:—(1) Reasonable preliminary sketches in pencil, revised until the wishes of the client are exactly ascertained. (2) Approximate estimate of cost, such as may be obtained by cubing. (3) Preparation of a full set of one-eighth scale drawings complete in all respects, with one traced copy of the same for the builder's use in carrying out the works. (4) A complete detailed specification, with conditions of contract and in duplicate, one copy being for the builder's use. (5) Advertising and obtaining tenders for the work if let by public contract. (6) Complete details, sufficient for the ordinary workman in each trade to execute his portion of the building. This would mean $\frac{1}{4}$ -inch or $\frac{1}{2}$ -inch scale drawings of the better class of work that might differ, and half and full-size sections of all mouldings and the more delicate parts, and that full and explicit instructions for the proper execution of the work should be given in all cases. (7) Personal supervision by the architect or his deputy should generally be made monthly, or say once in six weeks, dependent upon the size of the buildings. For all other services, such as extra copies of the plans for local authorities, for taking out quantities, surveys of site, arrangements with adjoining owners, travelling or other out-of-pocket expenses, the architect is entitled to charge separately.

I have made this statement for the benefit not only of my querist of the building committees, but also of architects who sometimes come across very exacting clients, who not only want occasionally a 4,000*l.* job done for half the money, but will put an architect to the trouble of drawing, and redrawing, until it is brought back bit by bit to the point where he has probably been told at the start that could not be exceeded for the proposed expenditure.

On the other hand, I have heard of architects, and some of them whose work has been hung in the Royal Academy, being content to supply builders with the flimsiest plans to one-eighth scale, partly drawn, some portions to scale and others not, with no specification nor detail drawings, and then expecting their 5 per cent., which I maintain is not fair to either the public or to their professional brethren, as it tends to bring architects and their work into disrepute. And in the question of personal supervision I have heard of cases of really large works of a national character where the architect has been seen on them only at intervals of six months.

To merit the public confidence we must, as architects, show ourselves to be worthy of it by our actions, and I think that perhaps, after all, it is well occasionally to recognise what our duties are, because, though the ninety-nine members of our profession may go perfectly right and the single one may not, we hear more of that solitary case than of all the others put together.

After describing improvements required in the Metropolis and provincial towns, the President said:—I fear, however, that my remarks have already been too long, possibly too discursive, and that I have trespassed too far upon your time and patience. I must therefore necessarily bring this address to a close, but having started out upon the practical or business

aspect of our profession, there is yet another point that I feel I must not omit upon an occasion of this sort, that is closely allied with building operations and the development of the best construction and the highest forms in our art. I refer to the tenure of land. The more and more I see of the evil results of the leasehold system in this country, one of the last relics of feudal times, the more am I constrained to speak out and to condemn it. It should be tolerated under no modern civilisation. It is unknown on the Continent of Europe. It is unknown in the United States. It has no hold in our Colonies. Even in Spanish and Portuguese America a building owner possesses the freehold of his site before he commences operations, and so it should be here, when one of the greatest aids that has ever yet been given to good building and true art would be afforded, as well as the greatest blow that could be rendered to the contemptible squalidness and jerry-building of which I have been complaining. Then the building owner would be interested in putting everything of the best, and having a structure that would not only last the lease out, but for all posterity. Because, if his own descendants did not wish to retain possession, they would still be interested in having the most substantial and artistic property for sale.

So far is this principle recognised in Austria, for example, that not only do they insist there in becoming the owners of the freehold before building, but the building owner is exempted for a fixed number of years from local taxation, in consideration of the advantage it is to the State in the fact of his putting a new building where previously there was either nothing or an old one. We can imagine what an impetus this would give to London improvement if the same principle was followed here, instead of the opposite, which is to immediately increase a building owner's assessment with every improvement he makes. Needless to say, with freehold tenure and relief from taxation upon improvements, in Austria we find some of the best building in Europe, whilst in England, where the converse obtains, we find some of the worst.

In conclusion let me say, however, that I am still a great believer in the destinies of our dear old country; that these and other obstacles to real progress will, by common consent, in course of time be removed, as have been others of equal importance, and that to the careful plodder in architecture, as in the other liberal professions, there are prospects still before us as good as any that have been enjoyed by our predecessors. That we should on every convenient occasion endeavour to make ourselves worthy of them. That our watchwords should be education, qualification and registration, and that by a strictly conscientious attention to our duties, we should command the respect, the confidence and the esteem of our clients and the public generally; for be it remembered that whatever we build cannot be hidden, and will stand permanently in evidence for or against us, long, long after all that are now in this hall have passed away and are otherwise forgotten.

LEEDS ARCHITECTURAL SOCIETY.

THE first meeting of the winter session of the Leeds and Yorkshire Architectural Society was held on the 21st inst. at Leeds. Mr. Butler Wilson, president, was in the chair.

The prizes were distributed to the successful students. For the best measured drawing work the prize was given to Mr. S. R. Day, of Skipton. To Mr. J. Hinchcliffe, formerly assistant with Mr. Bowman in Leeds, and now of Chorley, in Lancashire, four prizes, making a total of 11 guineas, were presented. One was for the design of a village church, another for the construction of a village church roof, a third for the best essay on ancient ecclesiastical architecture in Leeds, and a fourth for sketching. A letter was read from Mr. George Corson presenting to the Society the portrait of himself which had been given to him by the members of the Society. Mr. Corson was the Society's first president when it was founded twenty-five years ago, and it is partly in commemoration of that fact that the painting, which is by Mr. H. Wilson, was subscribed for. The gift was gratefully accepted.

The President then delivered the following inaugural address:—

Although you did me the great honour of election to the high office of President of your Society in May last (an honour for which, with a full and deep sense of its responsibility, I take this opportunity to offer my grateful thanks), the active duties of the office do not come into operation until November, that is, at this the opening meeting of our winter session. This arrangement has given the officers opportunity to prepare some plan of campaign for the year's work, and to deal with any matters of urgency that may arise during the summer recess.

One of the first questions to which your Council gave its attention was that of the increase of our membership, and I am indebted to the honorary secretary, Mr. H. S. Chorley, for the information that our numbers have increased since May by the addition of twenty-six new members.

It is a regrettable circumstance that some of our older members have seen fit to retire. There are one or two particular instances in which the members may have taken this step without due regard to the great respect which the Society has always had for them; and we hold out the hand of invitation to such, and ask that they would reconsider their action and rejoin us. The ultimate success of the Society will be found not so much in the increase of its membership as in the guarding of the entrance to its ranks. Nevertheless, your Council will continue their efforts so long as eligible men can be found who will add to its usefulness and influence.

During the summer two visits were paid. One to the Giggleswick school chapel and the other to two houses at Headingley.

Some six papers have been arranged for upon subjects which we trust will prove interesting to the Society. Full particulars of these will be found in the syllabus which has been sent to you, and we look for a good attendance during the coming winter.

It was thought that the information with regard to the Society, which in the past has had to be sought for in innumerable publications, might be epitomised, and the Council have therefore prepared a compendium, to which they give the name of "The Green Book." They hope that in this form it will prove more convenient and available for reference. The book will contain the rules of the Society, a full list of members, information as to classes at the Yorkshire College, the Leeds Institute, the Royal Institute of British Architects and the London Architectural Association, together with the President's address, which "The Green Book" waits to receive before being issued to the members. I am indebted to the hon. treasurer, Mr. W. H. Thorp, for the assurance that our finances till show a satisfactory balance.

The Council have to report the retirement of a gentleman who has adorned the profession in this district, whose character, abilities and work are too well known to you to need any remark from me. In Mr. George Corson the profession will lose an ornament, but we as a Society have every good wish for him in a well-earned retirement.

We have to note with regret the removal of Mr. William Watson from our ranks by the hand of death. Mr. Watson practised for many years in Wakefield, and occupied this chair 1866 to 1897. His ability, work and character commended itself to all who had the advantage of his acquaintance.

The Yorkshire Union of Artists place a certain amount of space for architectural exhibits in their annual exhibition, particulars of which are given in "The Green Book," and I trust our members will take advantage of this and all other means of properly displaying their best work.

Your Council have been asked to render advice and assistance in connection with a number of important matters. The Leeds Property Owners' Association requested your President to prepare evidence on their behalf against the Leeds Improvements Bill recently before Parliament.

The City Council submitted for our consideration and criticism the draft of the proposed new building by-laws, and we are to have the opportunity of being represented at the inquiry on this important matter before the Local Government Board inspector.

Your Council recently had the opportunity of pronouncing the opinion of your Society on the proposed Memorial in Leeds to Her late Majesty Queen Victoria. As a result of a suggestion made at a meeting of the Leeds Queen Victoria Memorial committee that your Society might be willing to render some assistance in obtaining designs for the Memorial, together with the architectural treatment of Victoria Square, your Council passed the following resolutions:—

"That in the event of the Leeds Queen Victoria Memorial committee deciding to place the proposed Memorial to Her late Majesty Queen Victoria in Victoria Square, it is recommended that the area of the square be increased, and that an architectural laying-out of the square form an inseparable part of the scheme."

"That a limited number of architects be invited to submit sketch designs for the Memorial, including the architectural surroundings and the laying-out of the Square."

"That an honorarium be paid to each for his services."

"That a professional assessor be appointed to place the designs in order of merit, and that afterwards the successful architect collaborate with the sculptor in the preparation of complete detailed designs and model of the Memorial itself."

These resolutions were forwarded to the ex-Lord Mayor, who laid them before the committee, and we have every reason to hope that they will receive consideration.

In the indication of these considerations, dealt with during the recess, which, I venture to think, are some evidence of the usefulness and standing of our Society in the city, I trust that it is shown that your Council have not been altogether idle in the fulfilment of the duties devolving upon it.

May I now address myself more particularly to the students? Perhaps we may lay hold of an odd thought here and there

which may be useful. The student of to-day is the architect of to-morrow, and all of us who have the least experience are more than anxious for his dignity, well-being and progress in the profession he has elected to follow, and which we all love. To him I would say that, in these days of accumulation of material things, men of high ideals are apt to forget, and are, indeed, in very great danger of losing altogether that magnetic quality or force which makes for the highest artistic work. It requires the very firmest effort to retain this quality—I refer to the vivifying and sustaining power, which for want of a better expression I would like to convey in the word enthusiasm. If in the course of anything one could say to-night all else were forgotten as one's words were spent, I should count myself fortunate if the humblest of us should carry away this word as his watchword for the year. "Enthusiasm"—in the possession of that the genius is spurred and sustained to his highest, and the man of less ability becomes more capable of receiving power from within and without, life is brightened and effort made possible to us all.

It becomes us individually, and as a Society, to sustain our art in the highest and best degree, and with each member filled with enthusiastic ardour there can be no doubt our Society will make more and more progress towards beautifying our cities and elevating the tastes of our fellows. To the student, enthusiasm must be accompanied with every searching into the details of our art, and all appertaining thereunto. The means of education of to-day open out a path by which you may follow in the footsteps of the authors of the greatest architectural achievements in the world.

This Society is, as you are aware, allied with the Royal Institute of British Architects. The Royal Institute has over 1,740 members, who are spread over, not only Great Britain, but His Majesty's dominions beyond the seas. Your President has a seat on its Council, where he is enabled to watch the interests and voice the opinions of your Society. London, the metropolis of the Empire, is only some 3½ hours' journey from this city, and membership of this allied Society will keep you in touch with the trend and development of the architectural thought which finds its base of operations at the Royal Institute.

There can be no better foundation on which to build the temple of your education than the working for the qualifying examination of the Royal Institute of British Architects. There are three examinations, the preliminary, intermediate and final. If you have not already done so, make it your business to pass the first as soon as may be, and if there is any student here who has not entered for it I earnestly urge him to do so, and at once. The hon. secretary is at my side to-night, and he will, I am sure, be only too glad to give you every information and help to remove any difficulties that beset your path in attaining to this, the first rung of the ladder.

I may say at this point that any number of qualifying medals and certificates do not necessarily imply ability of the highest order, but they are a strong guarantee that the possessor has at least satisfied his peers of his capability of ability, and to take a lower ground, "they confound the ignorant" and are useful in the possession of an otherwise able man. One could sum up all one had to say to the student in:—Equip yourself with all the knowledge and experience which your opportunities offer. Cultivate and maintain a large heart; have unshakable and abiding faith in yourself; keep an open mind, and keep on keeping it open; the world is yours.

To practising architects, engaged in successful enterprise and profitable work, I presume to offer the suggestion that unselfishness should be the keynote of our work. We owe a duty to the professional brethren of our day and generation. To the man of genius it is unnecessary to suggest sympathy with the young; it occurs. It springs naturally from the heart of a good and right-thinking man. We all of us, perforce, have every sympathy with struggling ability—it must be struggling and it must be doing. There is none for the shirker.

This Society was fortunate in having good men and true to help in its formation some twenty-five years ago, and the Society will continue to rely on the older, more experienced and successful of its members for internal support and sympathy.

We would impress upon senior members the necessity of them and their sympathy. We need them as a standby, useful should they fill but a listening part, which is by no means the least of good offices, thus giving younger members the advantage of the great help occurring through their presence and companionship alone. We must never forget our "Alma Mater," and I earnestly commend the well-being of our Society to you all, as your object of personal solicitude and care.

On this, the opening of our session, you will doubtless expect from me some statement with regard to the progress and outlook of our profession, and I venture to express the hope that in whatever I shall say to-night, I shall at least have attempted to follow the good example of those who have occupied this chair in previous years.

Any man who left this country twenty or even ten years ago is amazed on his return at the changes which have taken place in our towns and cities. There has been a vast increase in population and education, and, it follows, a greater amount of accommodation has been required for intelligent persons, so our great towns and cities have turned in their sleep, awakened, and are now in the process of rehabilitation. Re-building has been going on by leaps and bounds, and it will do so yet more rapidly.

Already the principal streets of our cities are overcrowded and almost impassable, and the necessity for subways is suggested on all hands.

In this wholesale reconstruction we see the danger of uncontrolled action and we, as being principally concerned in the responsibility, will have to take strong measures in dealing with this danger.

Our cities are of themselves undergoing great transformations—they are in closest touch with each other by railway, and also in many cases electric traction is establishing the greatest intimacy between them and their neighbouring villages. Most of the reconstruction seems to have been carried out without plan or system or any consideration for the ultimate development. No thought is given for providing great arteries of communication from centres to outlying districts; architectural treatment is uncontrolled; owners and builders seem to have had carte blanche for ugliness. I would suggest that these conditions ought to be effectively dealt with, and that schemes be prepared for the probable and ultimate development of our cities and towns consequent on their rebuilding, proper sites for future public buildings being carefully selected; that provision be made for subways, and that the insanitary areas be cleared in accordance with such schemes, so that the whole may be homogeneous as well as conglomerate.

That there would be difficulties arising from questions of compensation is apparent. These considerations and conditions are in the very slightest manner alluded to as probably composing the great problem which we as architects have to face.

Further, the formation of county councils in place of rural and urban authorities is resulting in the erection of public institutions, county halls, hospitals and asylums. These designs are often inadvisably obtained by competition—I do not now propose to consider the advisability of competitions. It is a question, and a much discussed one, whether it is not a clumsy and costly means of obtaining the best results; it is certainly very costly so far as our profession is concerned. The conditions of competition are usually unfair and unreasonable. The Royal Institute of British Architects have given great and prolonged consideration to this question and the best method of dealing with it, and we propose, in accordance with their wishes, to appoint a standing competitions committee, which shall communicate with all persons instituting them within our area, with the object of inducing such persons to proceed upon proper lines, both in their own interests and those of the profession.

Even in event of an architect winning a competition it does not always follow that the execution of the work is entrusted to him. The competition for the Liverpool Cathedral which took place some fifteen years ago, in which the prize was unquestionably won by Mr. William Emerson, an architect of great ability, immense experience and possessing the honour and confidence of the profession, is an example; he now occupies the presidential chair of the Royal Institute of British Architects for the third consecutive year.

The people of Liverpool were unable at that time to raise the money to prosecute his scheme, a scheme the profession had every reason to believe then inaugurated in good faith. Fifteen years have elapsed, and the present committee in this case say they are not responsible for the action of their predecessors, and have advertised for new designs. In their opinion, apparently, a man cannot wear the laurels he so justly won. I submit, gentlemen, that in common fairness and justice the commission for the Liverpool Cathedral should be placed with the architect who won it, and that the delay, for which he is not responsible, is no mitigation of the present position.

It will be within your recollection that the committee, who are now asking for new designs, in the first instance stipulated that the building should be in the Gothic style, with the result that a perfect storm of letters was received from men of position in the world of art, such a storm as culminated in the committee abandoning the original condition that the designs should be in the Gothic style.

It is a lamentable thing that in the construction of two large and important blocks of Government buildings in London designed by two eminent architects—who before a stone was laid were removed by the hand of death—I refer to the late William Young and John McKean Brydon, it is lamentable, I say, that the work should be handed over to H.M. Office of Works, who are to be responsible for the details which necessarily make or mar a building; it is regrettable that the emoluments due to the profession should

be diverted by Government officials. The seriousness of this was felt by the Royal Institute of British Architects, and they entered their protest against it. They also supported Lord Wemyss in his appeal to the House of Lords to move for the preparation of models for these buildings, and it will be within your recollection that his lordship carried his motion in the defeat of the Government, but we have yet to hear that any steps have been taken to have these models constructed, or to appoint a competent architect to carry the work to a successful conclusion. Our Society heartily supported and will continue to support the Royal Institute of British Architects in their action.

We are not so far removed from the centre of civilisation and examples of modern construction following on modern and untrammelled ideas, but that it becomes us to take advantage of other arts than that which we particularly claim as our own. Societies have sprung into existence which have for their object the study and design of ornament in nearly all materials. I allude more particularly to arts and crafts societies; it behoves us to keep in touch with them. We must guard against a tendency to stifle new and crude ideas, and give the "art nouveau" our earnest and helpful consideration when the exigencies of the case demand. The exhibitions of Paris and Glasgow, for example, were sources from which much could be learnt with advantage.

A cultivation of and a co-operation with the allied arts, and notably that of sculpture, is now a *sine quâ non*. Painters and sculptors have complained, and I am bound to say with some reason, that we do not always display a sufficient consideration for their work. As an indication of this feeling I may mention that a Royal Academician recently stated to me that the modern house is quite unfitted to contain a bronze.

But, gentlemen, there comes an end to all things. To quote a well-worn phrase, "*Ars longa, vita brevis est*." The fascinations of our art are enthralling, and it becomes an effort approaching a wrench to leave the considerations affecting her.

Gentlemen, we more and more realise the growing demands of our profession; we indeed serve a mistress who jealously insists that our effort, all our strength and all our energies and abilities shall be unreservedly laid at her feet, and that then, and certainly not till then, can we take from her hand the great rewards she has in store for them who are faithful.

Mr. H. Perkin proposed a vote of thanks to Mr. Wilson for his instructive address.

Mr. W. H. Thorp, in seconding, said that within a few weeks the Society would reach the twenty-fifth anniversary of its foundation. The presence of so many young members of the profession that evening augured well for the Society's future.

The President having acknowledged the compliment, the remainder of the evening was devoted to a smoking concert.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE second monthly meeting of the session was held on the 20th inst., the president, Mr. Chas E. Whitelaw, in the chair. Mr. Isaac Low delivered a lecture on "Old and New." Sanitation, he said, was the subject he had chosen to speak on, but before doing so he had a few remarks to make on lighting, past and present. He alluded chiefly to the Glasgow systems. In the course of his remarks on sanitation he described the various closets, from Bramah's to those of the present day. He next took up drains, and described the various methods that had been adopted in ventilating both closets and drains. In his closing remarks he dealt with sinks in use, and went back to the time when they were made of stone. At the close of the lecture Mr. Alex. McGibbon, after remarking on the able manner in which Mr. Low had treated his subject, moved a vote of thanks, which was heartily accorded the lecturer for his much appreciated lecture.

MODERN ARCHITECTURE.

THE opening meeting of the winter session of the Northern Architectural Association was held at 36 Northumberland Street, Newcastle, on the 13th inst., Mr. Frank Caws presiding.

In the course of his inaugural address he said:—

The nineteenth century will be distinguished by the future architectural historian as the most fickle century of all, in regard to the number, variety and incompatibility of the styles and fashions of buildings which it has so restlessly and inconstantly first embraced and then spurned. During this fickle century the battle of styles has been fought to a finish, not of the "final issue," which never can be finished, but to a finish of the two contestants, the old Classic and the resurrected Gothic, which entered both on the fray, and neither of which has survived. "As dead as Queen Anne" is an expression

which has passed into a common byword; yet it is remarkable that if there is any distinguishable survivor of the architectural fights of the great Victorian age it is the Queen Anne type, which still possesses much vitality, and seems to enjoy a fair prospect of extending its influence far into the twentieth century. Regarding the future of British architecture we need not ask "What will the end be?" For there will be and can be no end to the mutable fashions affected by restless humanity. Signs are not wanting that the rising generation of architects, to whom the twentieth century belongs, are coming to regard an intimate acquaintance with structural principles as a *sine qua non* of professional proficiency; for not merely statics, but also dynamics, are now included in the curriculum of the preliminary examinations which even novices must pass ere they can take rank merely as students of the Royal Institute of British Architects. The truly successful modern architect must of necessity be an artist, scientist and commercialist, and withal an excellent society man, all rolled into one. The popular measure of success is not supreme technical skill, is not even genius itself—that gift from the Highest to the highest—but is gold. This debasing influence reveals its presence amongst us by an increasing disposition to bribe clients to employ us by offering our services at rates of remuneration below the rates fixed by usage, and by which every member of the Northern Architectural Association and of the Royal Institute of British Architects, to which it is affiliated, is bound, in honour and fairness to his professional brethren, to firmly adhere. To what extent these nefarious practices obtain amongst architects it is not easy for the clean-handed to discover, even if wishful to probe foul waters. Too many modern attempts at originality in architecture issue in mere oddities and vulgar sensationalism. Cruel contortions of gable copings and pediments, coupled with rustication carried to absurd excesses, are having a run just now. But the public taste, though strong enough to enjoy almost any architectural novelty, however vulgar, will become soon nauseated with such wretched fare. Nature's method of originality is worthy of our highest emulation. She knows how to be unfailingly interesting and perpetually original within the limitations of type. For example, in her reproductions of the human face divine she never makes two alike. Every human face possesses individuality, *i.e.* originality. Yet the number and arrangement of the features are the same in all cases, the greatest differences of individuality being due to the smallest and most subtle variations. Nature's originalities are produced not by such horrible expedients as putting eyes in foreheads, or by other monstrous transpositions of features, but by the most exquisite touches of ineffable art.

ORGAN CHAMBERS AND ORGAN CASES.

AT the last ordinary meeting of the Sheffield Society of Architects and Surveyors, Mr. Charles F. Brindley (of the firm of Brindley & Foster) gave a lecture on "Organ Chambers and Organ Cases." He said the placing of an organ in either a concert-room, place of worship or a private house so as to combine to the fullest possible extent musical, artistic and utilitarian principles presents many difficulties. The organ might well be described as the most complex of complicated machines, the building of it necessitating an intimate knowledge of mechanics and science, and musical taste and culture must be present in a marked degree. He intended, however, only to deal with the considerations of placing and encasing instruments, which vitally concerned the work of architects. Dealing, first, with the placing of organs in concert-halls, the best position for the organ was the far end of the orchestra, and as an instance of good arrangement Mr. Brindley gave the case of the instrument built by his firm in the Town Hall, Pietermaritzburg, South Africa. Special attention should be given to allowing ample space, so that the organ may be built on one level, in order that it may not be affected by changes of temperature and so thrown out of tune by the consequent expanding of metal pipes when instruments are constructed at different altitudes. In providing for machinery for blowing, care must be taken that (a) the room be dry, (b) within reasonable distance of the organ proper, (c) the temperature be the same as that of the hall. Dealing next with the placing of organs in places of worship, the lecturer stated that not the least difficulty in this respect was the unreasonableness in some cases of the architect's client, who, although having no acquaintance with architecture or acoustical or musical knowledge, ruthlessly ignores the best suggestions, and cuts out those refinements and beauties upon the achievement of which the enhancement of reputation and growth of art have depended. Lack of space allowed and disregard to all proportion were the greatest evils. It was idle to point these defects out, as you were told if you couldn't do it others could. Mr. Brindley then gave the opinions of experts with regard to position. The placing of the organ on a screen dividing the

nave from the choir is undoubtedly the best, but is unfortunately seldom adopted and favoured by modern architects. Putting an organ in the west gallery is highly recommended by many experts. An organ chamber is not a good place for an organ. If this latter method be a necessity, the lecturer pointed out that it devolved upon the architect to design such chamber so as to mitigate the evil as much as possible by providing plenty of space, making it of sufficient height, and having ample opening into the church for the ingress of sound. Instances were cited of the organs built by his firm at St. Agnes Church, Kennington; St. Andrew's, Willesden Green; Wesley chapel, Fulwood Road, Sheffield; Congregational church, Bromley, Kent; Weigh House chapel, London. As exceptional positions for organs Mr. Brindley cited the instances of Christ Church, Sutton; Govan parish church, Glasgow; South Leith parish church, Edinburgh; parish church, Arbroath, where unquestionably successful results have been obtained by his firm owing to the care taken in designing and carrying out the work. Private houses present the greatest difficulties, owing to the invariable upset to the arrangements the introduction of an organ causes. Instances were given of the instruments built by Brindley & Foster for the late Duke of Sutherland in Stafford House, London, and for the well-known amateur, Mr. S. W. Pilling. In the latter case, no room being acoustically suitable for an organ, Mr. Pilling had one built; and his complete four-manual organ shows off to the greatest advantage. Mr. Brindley then dealt with the casing of organs, and dealt with technicalities in connection therewith of great interest to architects, in order that in their designs everything might be arranged to the enhancement of the effectiveness and appearance of an instrument. With regard to decoration, Mr. Brindley stated that the silvering adopted by his firm was well received by architects. The great thing was not to decorate pipes so as to spoil their appearance as metal pipes. The lecturer considered that inasmuch as front pipes were never made of gold, gilding might be considered somewhat out of place. Spotted metal was subject to rapid tarnishing. The number of stops depends on the price paid and the quality of the builder's work. A first-class built organ has pipes of full size, the pipes have each ample speaking room and of good calibre. In short, a properly-built organ may be from 50 to 60 per cent heavier in weight than that of an organ of the cheap class. Consequently a first-class builder requires more room for a given specification than the inferior builder would know what to do with. Mr. Brindley pointed out that it was possible for an organ-builder to supply an organ to a given specification for perhaps 20 per cent. less cost than it would cost his firm in materials and workmanship. He therefore urged architects to not unduly limit the organ space if they desired to safeguard their clients' interests. An organ-builder can be of great assistance in the initial stage to an architect by giving him help and placing before him those essentials with regard to shapes and measurements without which the most artistically designed cases cannot be perfect.

CROSBY CHAPEL.

THE eighth sessional meeting of the Historical Society of Lancashire and Cheshire was held on the 21st inst. Mr. William E. Gregson read a paper on "Crosby Chapel, Great Crosby. Mr. Gregson offered the suggestion that although the church is now known as St. Luke's, the probability is that the ancient chapel was dedicated to St. Michael the Archangel, patron saint of the township and manor, to whom the ancient village well on the Green is dedicated, and in whose honour the cross on the Green seems to have been erected. After reading translations of a couple of ancient charters, one granting a certain stipend to the priest at "Croseby," from Savaric, Abbot of St. Mary's at York, and the other being a grant by Walter, son of Earl Gospatric and Cecilia his wife, of the church of Crosby and St. Nicholas by the Sea, to the Abbot of St. Mary's at Carlisle, Mr. Gregson threw some doubt as to whether these documents really referred to Crosby in Lancashire. In the subsequent discussion Mr. Alfred Patchett confirmed to some extent the conclusion that the deeds referred to one of the Crosbys in Westmorland. The site of the ancient chapel was located as far back as the reign of Edward VI. as being built where the National school now stands, and the fabric was valued at that time at 30s., and the armaments of the chapel included a little bell, a silver chalice partly gilt, gold altar "clothes" and sundry vestments. This old building was altered at various times and a brick building with a tower seems to have been erected in 1767 or thereabouts. This building (except the tower) disappeared about 1840, when the new church was built, and the tower was finally demolished in 1880. Mr. Gregson gave a fairly complete list of the curates or incumbents of the chapel, commencing with the Rev. John Kidd, M.A., who had the chapelry in the reign

of Elizabeth. Probably the chapel was served by one of the numerous priests attached to the Sefton Church before that reign. The only known sketch of the old chapel is one in the Binn's collection at the Picton Reading-room. Most, if not all, of the incumbents previously to the present vicar, the Rev. Robert Love, M.A., have been masters of the Merchant Taylors' School, Crosby.

A discussion followed, in which Mr. W. Fred. Price, Mr. Alfred Patchett and others took part, and the meeting closed with a vote of thanks to the reader of the paper.

THE HALL-I'-TH'-WOOD, BOLTON.

AT intervals during the past twelve months reference has been made to the work of restoration which is being carried out at Samuel Crompton's old home, the Hall-i'-th'-Wood, which is now the property of the Bolton Corporation, and is being entrusted to the parks committee for equipment and management. One of the representatives of the *Bolton Chronicle* visited the picturesque old mansion and found that a vast amount of labour had been expended on the building in the work of preserving it both internally and externally. This has happily been effected without affecting the structural arrangements of the Hall. Its ponderous oak beams, post and plaster walls, mullioned windows, great open fireplaces, and its quaint elaborately carved staircases are there just as prior to his death in 1827 Samuel Crompton used them in his daily life. There are eighteen rooms in the building, and all have been dealt with, and are now virtually ready for their future use as an industrial museum and a repository of the great inventor's relics. The only articles at present in the Hall are three old oak chests from Cocker's Farm, Rivington, an ancient oak cabinet, a primitive stone cheese-press and several remnants of textile machinery under the rafters where Crompton secreted his inventions. The coats-of-arms and initials over the fireplaces are undisturbed. The latter include the letters "A N A" (Nathaniel and Ann Archer) and "B L B 1591" (Lawrence and Betty Brownlow, the family identified with Brownlow's charity. In the yard in front of the building a relic of ancient days and customs is to be seen in an arrangement of stones reared for the purpose of enabling ladies to mount their horses. It is proposed to surround the Hall by a garden, and there is no doubt when completely equipped the Hall and its surroundings will be a very interesting resort for both antiquarians and the ordinary visitor. The last occupants of the Hall were Thomas Jackson, who was in the building six or seven years, and Arthur Bromiley, who was a previous resident in it for over seventy years. The present caretaker is William Platt.

TESSERÆ.

The Art of the Germans.

IN considering the subject of art in Germany we find ourselves confronted with a strangely perplexing phenomenon, for we are brought face to face with a people possessed during many centuries with a strong craving for artistic expression, and reaching on occasions to achievement of a very high order, and yet as a whole much wanting in qualities we connect with the artistic temper, and which are no doubt indispensable for the attainment of supreme excellence—a people which, through the exceptional fruitfulness of its æsthetic impulses, or more accurately perhaps of its desire for expression through form and colour, and in virtue of the power, the thoroughness and the masculine sincerity which stamp its handiwork, establishes a just claim to a prominent place in the wide republic of the arts, and has nevertheless put upon the world by the side of many and noble masterpieces a quite curious amount of ungainly and at times all but repellent work. Certain qualities seem to be wanting in the æsthetic constitution of the race, and these are the instinct—meaning, of course, in the graphic arts—of congruity and fitness, the sense of rhythm and a perception of the value of restraint and of repose, attributes in the presence of which the highest sense of beauty would be sought in vain. It is impossible, indeed, to survey, however cursorily, the immense field of German activity in art without being powerfully impressed by the high qualities revealed in every part of it; nevertheless the final impression left by such a survey is of a people amongst whom the ethic sense is constantly predominant over the æsthetic impulse, and we are made conscious that if we have been frequently moved to respectful appreciation and admiring wonder, it is but seldom that we have been conscious of that sweet, that enveloping, that sufficing sense which has its springs only in the æsthetically beautiful.

Non-Isolation of Gothic Cathedrals.

It is a great mistake to think, as has often been maintained, that Gothic cathedrals need to be completely isolated to produce all the effect which their architecture is capable of;

the constructors of those cathedrals do not, and nowhere have they been seen. There does not exist in Europe a cathedral originally flanked at the north or at the south by the palace of the sovereign, the canons, their chapter-house and their cloister, as in the case of the cathedrals of the Middle Ages, where they were necessary to lodge the chapters, and where they were numerous and very rich. In England, where the cathedrals have preserved these dependencies but the body of the church, and although they are for the most part very much inferior to those of the Middle Ages, Montalembert says they often strike us as being precisely owing to this encircling, whose intimacy with those of the central monument tell more of the grandeur of the admirable edifices than of all terrene grandeur, has need of points of comparison to make them to be appreciated and stand out from the surrounding edifices so as to hide not only from the eye which contemplates them, but also from the mind which permits, as at Rouen and elsewhere, the like a crust between the buttresses. But the cathedrals make a void around our cathedrals, so as to make the magnificent dimensions which they give to their authors. They were not at all the Pyramids of Egypt; but, otherwise, crowded dwellings and the narrow streets of the Middle Ages to domineer and raise our imagination of the truth and of the authority of that which the cathedral was the image in stone.

Proportions of Rooms.

If there were any absolute and fixed proportions of objects, it seems reasonable to suppose that every violation of them would be equally objectionable. Every deviation from them would be attended with a certain degree of discontent. Take the proportions of a room. The height, the length or the breadth of a room must have observed that it is with regard to the want of proportion in these things that we feel a great height in a room is not nearly so objectionable as a height, and too great a length produces a feeling of discontent, compared with that which is produced by a breadth. Whether a room is a few feet too high or a few feet too broad, few people observe; but every one observes a disproportion either in the diminution of its height or in its breadth. The most general fault in the proportions of a room is that the common people find with apartments too low or too broad. The proportions of a room they seldom attend to if they are not very objectionable. The facts are not easily reconcilable with the absolute beauty of these proportions. The disproportion from the expression of fitness, the proportion of a room should affect us the most ought to be the most necessary for the production of the effect. However, very obviously are either too low or too high, the first immediately indicating the disproportion, the roof, and the other expressing the disproportion of the sufficiency for the support of this weight. The form of an apartment, accordingly, that is that of being at the same time very broad and very high. Too great height and too great length have not so disagreeable expressions as too great breadth. Fitness is in no material degree violated by a disproportion of height or length; it is chiefly a slight emotion of dissatisfaction, unsuited to the general character of the room. Our indifference to the second disproportion, length, arises from a different cause, viz. that the beams which support the roof are not so numerous and our consequent belief that the difference makes no difference with regard to the effect. Change accordingly in any apartment the proportions of the beams, let the spectator perceive that the height is too great, or the length too great, or the breadth too great, and the room, however great length these dimensions are, the greater length will be permitted without any feeling of disproportion. It is expressive of perfect sufficiency in the proportions of the roof. As there is thus no uniformity in the perception of these proportions, the case if their beauty were perceived, and as the emotion which we in fact feel is different according to their different proportions, it seems reasonable to ascribe their beauty to the proportions, and not to any original beauty in the proportions. If there were any original beauty in the proportions, it would necessarily be as certain as the fact that the sense, and there would be one precise proportion of length, breadth and

manently beautiful. Everyone knows, however, that this is not the case; no artist has ever presumed to fix on such proportions, and so far is there from being any permanent beauty in any one relation of these dimensions, that the same proportions which are beautiful in one apartment are not beautiful in others.

Kew Cowl Tests.

SIR,—As the Sanitary Institute have not answered the queries contained in my letter published in your issue of the 15th inst. it must be assumed that they prefer to allow the question of the cowl patents held by them to drop. Of the wisdom of this course in the face of the absolutely unanimous condemnation of the tests and of the report which has appeared in the Press, of which the following extracts are fair specimens, the responsible officials of the Institute are, of course, the best judges:—

(a) "It is a significant fact that this would-be scientific report awards the palm for efficiency to a cowl or terminal of which the Sanitary Institute themselves hold the patent—a result which was not very difficult to attain when the method of experimenting was exactly such as to favour the cowl in question or the open pipe principle."

(b) "It may, however, be said that they have done too much. Instead of simply laying down the lines upon which, as an outcome of their tests, it was advisable to construct these cowls and to show what should be avoided on the one hand and what should be provided on the other, in order to give the best possible results, they have given their *imprimatur* to three specified models, which they have patented."

(c) "The public do not like that kind of thing. They will say:—'In order to make themselves an authority on cowls, the Sanitary Institute conducted experiments on them, and then, having taken up the position of judges, and acquired all the authority, they now come into the market with a cowl of their own. These are the things which put one against hole-and-corner experiments . . . To private experiments nobody can take exception; public experiments everybody must welcome, but secret experiments, which are neither public nor private, but are sheltered under the ægis of a scientific society, must invariably create suspicion and distrust'."

(d) "A perusal of the report can only excite feelings of astonishment and commiseration in the minds of those acquainted with the facts, particularly after reading Professor Shaw's condemnation of the conclusions arrived at. . . They must have known, from Professor Shaw's investigations, that the tests, for all practical purposes, were valueless, and could only prove misleading and harmful. . . . The Institute has done much good work in the past, and may do still more in the future, but it must abstain from making such fatuous attempts to pose as an authority upon a subject which it is clear from the report it knows very little about."

(e) "It would have been well for the dignity of the Sanitary Institute had the tests remained unpublished."

As stated in my letter, I notified the Sanitary Institute on the 9th inst. that their alleged "Champion" cowl was an exact replica of an old chimney-cowl first made by me over thirty years ago, and that if they cared to send a responsible person to my office I would show him diagrams and models of this cowl, and also the identical cowl itself, besides several other modifications of cowls on the same lines and the later and more effective forms. Though the receipt of my letter was acknowledged no one has as yet (November 25) called to inspect the cowl and the diagrams, the latter appearing in old price-lists.

In large sizes, for several reasons arrived at from actual practical experience (which reasons the Institute appear to have either ignored or to be ignorant of in their application to their cowl), I never considered this chimney-cowl good enough to make a ventilator of, and I think that the Sanitary Institute would have arrived at the same conclusion if they had made the tests with full-sized specimens, such as are used for the ventilation of buildings, instead of with models, as was done.

What surprises me most is that the Institute, and particularly the cowl-testers, should have been ignorant of the existence of this cowl, which for many years past has appeared as a standard pattern in the catalogues of the principal chimney-cowl makers, and is to be seen on the tops of thousands of chimneys in London and elsewhere, though it is rarely or ever used as a ventilator, cowl-makers being aware of its weak points when employed for that purpose. If the Sanitary Institute had responded to my invitation to inspect this cowl, I think I would have had no difficulty in convincing them of the fact that it was by no means infallible by one or

two very simple experiments, and which, I observe, were omitted to be made at Kew.

At my testing-rooms, where experiments with innumerable modifications of every conceivable form of cowl and other ventilating appliances have been continuously carried on for at least a decade before the birth of the Sanitary Institute—improvements being strenuously and unremittingly sought for—a further revelation might also have been made as to how cowls should really be tested, to arrive at an approximate knowledge—which at the most is all that can be attained—of their values. I need hardly say that the methods of testing employed are not as were adopted at Kew. The tests are also made with full-size ventilators and not with models as at Kew, and which prove nothing.

It is now well over fifty years ago since my late father as a co-worker with Professor Faraday first practically devoted his attention to the subject of ventilation, and the natural system of ventilation which is now so generally employed in all parts of the world was the outcome of their joint labours. I merely mention all this to show that such things as ventilators and testing ventilators were known before the Sanitary Institute commenced their investigations, and that therefore they (the Sanitary Institute) cannot rightly claim to be the first inventors of the one nor the originators of the other.

I myself may also claim to having contributed towards the elucidation of the problem of ventilation, having made the subject the exclusive study of my life and visited almost every known country preaching the gospel of pure air, having, indeed, when so engaged travelled seven times round the world, whilst probably about three-quarters of a million sterling has been expended in the practical development of the subject.

I notice that the Institute's second best cowl, which they have patented and which is described in the report as a "Twirler" (a good scientific name, by the way), is also of hoary antiquity. In my childhood's days it used to be known as an "Old Wife," and many a weary night have I been kept awake listening with awesome dread to the weird "voices of the night" as that very querulous old lady squeaked and groaned on her rusty spindle.

With regard to the Institute's third best "terminal," though it is well known that the Patent Office, with the true British commercial instinct, never refuses money and will grant a patent for almost anything, I thought it would have drawn the line at an open pipe; but it seems that this supposition was a mistaken one, though it really does not matter seeing that everything connected with these "prehistoric" tests—including, I regret to say, the testers themselves—has long since passed away and ceased to exist as a practical entity. In connection with this the following extracts from the Press are instructive:—

(a) "The lapse of time has rendered most of the cowls and terminals obsolete, and beyond this the improvements and modifications that have been made in ventilators have been ignored, and a corresponding degree of scientific data are necessary for accurately determining their action, which the present report does not supply, as it does not deal with these improved ventilators."

(b) "They must relate to things which are no longer to be found in the same form. There are improvements in ventilators as in other appliances, but in the experiments it might be supposed that invention was to remain inactive until the report was published."

(c) "The science of ventilation by means of cowls has progressed so much since the tests now described were made, that the varieties of cowls used in the experiments have become obsolete. . . . We cannot help feeling that a report dealing with cowls and ventilators long since consigned to the scrap-heap and the spelter-pot should not be taken seriously, although, of course, its antiquarian value need not be disputed."

(d) "The prehistoric character of those particular experiments becomes more and more evident. 'Months were passing into years, and years into decades,' it tells us, 'with the work still unfinished.' . . . The date, in fact, runs back so far as August 1877, which seems now quite a prehistoric period. We feel almost as though we were opening a book of Herodotus, or glancing at the clever cuts in certain recent American journals illustrating the manners and customs of our ancestors in the Flint Age and other palæozoic periods."

(e) "An egregious blunder. . . . That it has no practical value may safely be asserted, if only for the simple reason that it does not cover the up-to-date ventilating appliances now on the market."

With regard to the actual practical value of the tests, the correctness of the methods of testing and of the conditions governing the tests, Professor Shaw, the eminent scientist who compiled the report, and who was called upon by the Sanitary Institute to decide upon these all-important points expresses himself as follows:—

"In an introductory note to Part V. of the report I have given my reasons for thinking that the ratios obtained by the cowl committee depend upon the other part of the experimental

arrangement, and not upon the terminal portion only, and that in consequence the word [efficiency] is not applicable . . . It would appear that the want of agreement of the readings of the different instruments caused some hesitation about accepting a final value. All the evidence seems to have been set out, but the verdict was not given, and I have had to take up the difficult task of a jury and pronounce 'Yes' or 'No' upon the questions which were to be answered for the committee upon the facts they had collected." (P. 205.)

"It will be well to consider briefly the conditions governing the flow of air up a pipe under circumstances similar to those prevailing at the Hut, and it will be seen that the effect of a cowl or terminal cannot usually be regarded as being completely dealt with by a single factor, or series of factors, representing efficiency, even for a single set of conditions, as to the direction and force of the wind under which the flow takes place." (P. 340.)

"The numbers so obtained for ratios of flow will accordingly not give anything which can be regarded as a 'constant' for the cowl, or which will serve to identify the effect which the cowl would produce in the way of alteration of aeromotive force or alteration of resistance in circumstances slightly different. The numerical result is, in fact, due to the special combination of circumstances, and could not be reproduced unless the circumstances were themselves approximately reproduced." (P. 344.)

"The numbers obtained for the ratio of the flow along the pipe carrying the cowl to the flow without the cowl give us nothing that can be regarded as a constant for the cowls, and consequently the use of the term 'efficiency' to denote the ratios obtained is inappropriate." (P. 344.)

This clearly endorses the verdict of the *Times* on the first instalment of the report (described as "the greatest blunder in the history of sanitary science"), which was that:—

"The method of testing was incorrect, and therefore the tests are valueless. Neither in the case of either of the cowls or the tubes was their true value as extractors ascertained."—I am, yours faithfully,

ROBERT BOYLE.

64 Holborn Viaduct, E.C. : November 25.

GENERAL.

The Exhibition of plans and drawings of the Queen Victoria Memorial at St. James's Palace will be closed after Saturday, December 7.

The Winter Exhibition of the Royal Society of Painters in Water-Colours will be opened on Monday next.

Mr. Walter R. Knappe, M.I.C.E., died last Monday in his sixty-ninth year. He was largely employed in harbour work and other important undertakings.

Dr. Henry Woodward, under the age limit, has retired from the Keepership of the Geological Department of the British Museum of Natural History.

Professor Corfield, of University College, London, the consulting sanitary adviser to His Majesty's Office of Works, has received from the Royal Society of Public Medicine of Belgium its bronze medal in recognition of his devotion to public health.

Application is to be made by the Guardians of the North Dublin Union to the Local Government Board for sanction to a loan of 35,350*l* for the completion of Portrane asylum. The Board of Control had entered into contracts to the amount of 200,000*l*., but had provided 46,000*l*. less than that sum.

An Application has been made to M. Pacully, of Paris, the French amateur, by the Royal Academy, asking him to contribute some works from his valuable collection for the forthcoming Winter Exhibition.

Hogarth House, Chiswick, for many years occupied by William Hogarth, was sold by auction on Monday last for 1,500*l*. The property, including half an acre of garden, is copyhold of the prebend manor of Chiswick; it was sold with possession. The identity of the purchaser was not disclosed.

Mr. E. Alfred Rouchling will read a paper on "The Sewage Question during the last Century" before the Society of Engineers on Monday.

An Exhibition of Paintings will be held in the spring in the gallery of the Automobile Club in Paris. Among the painters who will contribute are MM. Carolus-Duran, Cormon, Roybet, Aimé-Morot, Friant, Demont-Breton, Gabriel Ferrier, Wincker, Jean Béraud, Boldini and Zwiler.

The Offices in Princes Street designed by Sir John Soane are to be taken down in order to use the site for new offices in connection with the Bank of England. A subway will be also constructed.

The French Government have formally accepted the bequest of gold and silver plate, valued at 135,000*l*., left by Baron Alfred de Rothschild to the Louvre.

Mr. W. A. Paley has been appointed to succeed the late Mr. Palfreyman as engineer at the House of Commons. There were upwards of 150 applicants for the post.

The Cowes Council have decided that a new hall and offices are to be provided if a suitable site can be found, and the work carried out at a sum not exceeding 4,000*l*.

The Edinburgh International Exhibition is to be held in the year 1907. An application is to be made forthwith to the Town Council to grant the use of the West Meadows and the lower part of Bruntsfield Links as a site for the exhibition.

The Emperor of Germany is having prepared for presentation to the Senate of Harvard University a unique collection of plaster casts representing some of the finest German Mediaeval stonework, such as the tracery in the choir of Halberstadt Cathedral, to be placed in the Germanic Museum of the University.

Sir Edward Antrobus, it appears, is within his rights in enclosing Stonehenge. It was announced at a meeting of the Wiltshire County Council that he might be willing to sell, and the hope was expressed that the nation would buy the place.

A Public Meeting was held at Freshwater to consider the alternative drainage scheme and outfall works as suggested by Messrs Bennett & Masters, when it was unanimously decided to ask the Local Government Board to adopt this scheme in preference to that of Mr. George Chatterton, who had practically the support of that body in the drawing of his plans.

Mr. Ernest Newton was the architect for the new buildings, consisting of vestries and vicarage, in connection with St. Mary's Church, Hoxton, which were dedicated on Saturday. The cost, including the site, was about 5,000*l*.

Sir William Roberts-Austen will deliver the tenth "James Forrest" lecture at the Institution of Civil Engineers on April 17, the subject being "Metallurgy in Relation to Engineering."

The "London Gazette" announces the dissolution of the following partnerships, viz Sir J. Wolfe Barry, H. M. Brunel, C. A. Brereton, A. J. Barry, K. Wolfe Barry and B. Leslie, civil engineers, under the style of Sir John Wolfe Barry & partners, Delahay Street, Westminster, S.W.; and F. S. Waller and F. W. Waller, architects, Gloucester, under the style of Waller & Son.

A Paper will be read by Mr. E. E. Bateman on Monday before the Liverpool Architectural Society on Castle Bromwich Church.

The Bath Council are about to make application for a loan of 16,000*l* for the purposes of a housing of the working classes scheme for Lampard's Buildings. The street improvement would cost 9,000*l* and the erection of the houses 6,965*l*. The thirty-six houses would be let at rentals varying from 3*l*. to 5*l*. 6*d*., as against a rent paid for the old hovels of 2*l*. 6*d*. to 3*l*. 6*d*. The gross rents would be 500*l*., and after making allowances for repairs the net receipts would be 334*l*.

The New Dock Offices for Liverpool will shortly be commenced from the design of Messrs Briggs & Wolstenholme and Messrs. F. B. Hobbs & A. Thornely. The cost is estimated at 257,246*l*.

A Marble Statue by the Viennese sculptor Herr Hasselrus of Heinrich Heine, the poet, was unveiled last Sunday at his grave in the Montmartre Cemetery. It was the gift of Austrian admirers.

The Municipal Council of Paris have considered scheme of various works which it is proposed to undertake in 1902. The estimated amount exceeds 7,000,000*l* sterling.

The Carpenters' Company's annual examination in sanitary building construction was held in their hall during last week and the following awards were made:—To Mr. F. Hartnoll, special prize of books, he having already obtained the silver medal; to Mr. H. Barnsley and Mr. H. Gerner silver medals; and to Mr. G. H. Lovegrove, Mr. E. W. I. Martin and Mr. A. Norton, bronze medals.

A Foreign Company, it is said, is about to erect building on the principal boulevard of Paris, and the price paid for the site is said to be 90*l* a square foot. The company had negotiated for another corner in the same locality, but had to abandon the idea because the proprietor asked 180*l* a square foot.

Mr. Joseph Berry, architect, of Huddersfield, has removed his offices to No. 3 Market Place.

Mr. C. J. Innocent, architect, of 22 High Street, Sheffield, announces that he has taken into partnership his son, Mr. Charles Frederick Innocent, who has been associated with him for several years.

The Civil Service Commissioners announce that an open competitive examination for three appointments of assistant civil engineer in the Admiralty Works Department will be held shortly. Copies of the regulations and forms of application for admission to the examination may be obtained on application, by letter, to the Secretary, Civil Service Commission, Westminster, S.W.

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

AUSTRALIA.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

BURSLEM.—Dec. 20.—Competitive plans are invited for an isolation hospital. Premiums of 100*l.* and 50*l.* will be awarded to the designs placed first and second respectively. Mr. Arthur Ellis, town clerk, Burslem.

GLASGOW.—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

HULL.—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs

placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

KENT.—Jan. 1.—Competitive designs are invited for laying out about 16 acres of land, near Canterbury Road, Gillingham, as a recreation-ground. Premiums are offered of £20, £10 and £5. Mr. F. C. Boucher, clerk, Gardiner Street, New Brompton, Kent.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

SCOTLAND.—Jan. 15.—The Kirkcaldy Burgh School Board invite competitive plans for a technical and science and art school to accommodate from 400 to 500 pupils, and an elementary school to accommodate about 400 pupils. Mr. Alexander Beveridge, clerk to the Board.

WITHINGTON.—Dec. 5.—Schemes and tenders are invited for kitchen equipment (cooking appliances) at Baguley Lodge Sanatorium. Mr. James B. Broadbent, architect, 15 Cooper Street, Manchester.

CONTRACTS OPEN.

ALNWICK.—Dec. 14.—For erection of proposed Duke's school, Alnwick. Mr. T. Pickard, Estates Office, Alnwick Castle.

ANNFIELD PLAIN.—Dec. 7.—For additions to mixed school, Annfield Plain, Durham. Mr. Geo. Thos. Wilson, architect, 121 Durham Road, Blackhill.

ARGENTINE REPUBLIC.—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

AYLESBURY.—Dec. 2.—For installation of a heating apparatus, with hot-water pipes, radiators, valves and fittings, at the town hall and public offices. Mr. J. H. Bradford, surveyor, Town Hall, Aylesbury.

AYLSHAM.—Dec. 2.—For conversion of dormitories into sick wards at the workhouse at Aylsham, Norfolk, installation of a hot and cold-water supply, heating by hot water, construction of invalids' lift and iron emergency staircase. Mr. John B. Pearce, architect, 15 Upper King Street, Norwich.

BAKEWELL.—Dec. 13.—For supply of turned and bored spigot and socket cast-iron pipes. Messrs. Sterling & Swann, engineers, Town Hall, Chapel-en-le-Frith.

BARKING.—Dec. 10.—For construction of a portable floor to the swimming pond at the public baths, East Street. Mr. C. F. Dawson, surveyor, Public Offices, Barking.

BARNSELY.—Dec. 5.—For erection of three dwelling-houses, stables, harness-room, &c., in Cope Street. Messrs. Senior & Clegg, architects, 15 Regent Street, Barnsley.

BETHNAL GREEN.—Dec. 10.—For water-supply works at the workhouse and for the infirmary, comprising—(1) Enlarging the existing well and lining with iron cylinders; (2) supply and fixing of two gas-engines and pumping machinery; (3) erection of water-tower; (4) supply and fixing of cast-iron tank, about 70,000 gallons capacity; (5) supply and laying of 6-inch mains, &c. Mr. G. H. Hughes, engineer, 97 Queen Victoria Street, E.C.

BIDEFORD.—Dec. 9.—For erection of infirmary buildings at the workhouse. Messrs. R. T. Hookway & Son, architects, Bridgeland Street, Bideford.

FRED VERITY & SON (Late VERITY BROS.) CALL LANE, LEEDS.

A NEW ARTIFICIAL STONE.

WE hear that a new artificial stone, the invention of Mr. Wm. Owen, and essentially different from anything hitherto submitted to the public, will shortly be placed on the market. The ingredients of which it is composed are stated to be sand and lime solely, without admixture of chemicals of any description, and it is claimed that the product is a close-grained homogeneous material, hard, with true surfaces, which can be made to stand from 250 to 400 tons crushing strain per square foot—as may be desired for ordinary or special purposes. The finished stone can be masoned or carved. Cubes in the shape and sizes of ordinary bricks, blocks, sills, heads, ashlar, &c., in various tints can be made ready for use in six to ten hours, at a cost which has hitherto been unapproached. It is stated, moreover, that the apparatus requires very little manual labour. An artificial stone like this, if it fulfil all promises, should be of great value, and we shall probably be able shortly to furnish further particulars relating to it.

GERM-PROOF FILTERS

Dr. ANDREW WILSON writes as follows:—"The filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (*i.e.* germless) water, and thus prevent typhoid fever and many other diseases."

MOST EASILY CLEANED.

SIMPLE IN CONSTRUCTION.

Water drawn direct from Filters attached to the service pipe, without interfering with the ordinary draw-off tap.

Full particulars and Illustrated Price List on application.

Architects are invited to see these Filters in operation at the Showrooms.

THE FURNITURE TRADES MUSICAL SOCIETY.

ON Monday evening last the above Society held their first Bohemian concert of the season in St. James's Hall, Regent Street, W. The chair was occupied by Mr. James H. Faulds, who proved an excellent chairman. Mr. Marriner, the president, and the chairman both spoke very earnestly of the necessity of the trade combining together to protect their interests, and called attention to the fact that pleasant little meetings, like the present concert, helped to bring one and all together, giving them an opportunity of knowing and appreciating one another better. Mr. Marriner made an earnest appeal for the Trade Benevolent Fund, which was doing such good work, and which the Musical Society was endeavouring to assist. The objects of the association are as follows:—

To bring together the various members of the Furniture and Allied Trades (wholesale and retail) at certain musical entertainments during the winter months. The profits to be devoted to the charitable fund. The subscription is quite a nominal one, and all who are in any way interested in the Furniture and Allied Trades are eligible for election. The programme provided for the members and friends was a long one, and in every way excellent; the only drawback was that time passed much too quickly. Comprising as it did so many interesting or amusing items, it must not seem to be drawing invidious attention to mention specially two items—the singing of Miss Florence Machin and the performance of the Alexandra Mandolin, Banjo and Guitar Orchestra. The committee are to be congratulated warmly on their success, particularly the chairman of committee, Mr. Lampard, and Mr. Botwright (the proprietor, as Mr. Faulds put it, "of our bright little trade journal, the *Furniture Record*"). The next concert will be held in January 1902, and, judging by the enthusiastic reception accorded the announcement of the fact, it will be, if possible, even more popular than that which has passed.

SCHOOL OF ART WOOD-CARVING.

THE School of Art Wood-Carving, Imperial Institute, South Kensington, has been reopened after the usual vacation, and we are requested to state that some of the free studentships maintained by means of funds granted to the school by the Technical Education Board of the London County Council and by the Drapers' Company are vacant. The evening class is for the present closed, but to meet the requirements of those professionally engaged during the week a special Saturday afternoon class is held. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

TRADE NOTES.

WE understand that the fireproof quick setting adamantine plaster, manufactured by G. M. Restall & Son, of Birmingham, was used in the plastering of the new Hôtel Victoria, Nottingham. This hotel (one of the finest in the provinces) was formally opened some few days ago.

THE new gymnasium and institute, which is now in course of erection at Camelon, Falkirk, is being ventilated by means of Mackay's patent direct-acting ventilators, supplied by Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester. Mackay's air-inlet panels are being used for the admission of fresh air.

ALTHOUGH Messrs. Smith, Walker & Co., of 37 Old Queen Street, Westminster, S.W., only commenced business as a firm of constructional engineers in the early part of 1901, they have secured steel construction and concrete floor contracts to the value of over 10,000l., a sure proof of the confidence placed in them by the various well-known architects by whom their work has been specified. One reason for the success is the resolve of the firm to deliver steel and ironwork for buildings within the time guaranteed. To most architects this is an all-important point. Messrs. Smith, Walker & Co. are always prepared to give architects the benefit of their experience on all varieties of steel construction.

ELLISON'S "Hopper" Inlet Ventilator is already favourably known to many of our readers, a large number having been fixed in many parts of the country. As will be seen, it has an

ornamental appearance, and when closed is flush with the wall. It has, however, other merits to commend it. The movable part

being balanced, it requires no cord or balance weight, it is easily fixed, and while admitting a large quantity of air, does not create a draught, the air passing through it being directed upwards. The front part is readily removed and replaced when necessary for cleaning, &c.

BUILDING AND BUILDERS.

PLANS have been passed for the proposed Port Glasgow post office, which is to be erected by Messrs. James M. Brodie & Co.

THE Folkestone Town Council is considering the erection of a dust destructor, suitable land having been offered at 1,500*l.* per acre.

WORK has just been started in George Street, Hull, in connection with the erection of a new theatre, which will be the third in the city. The existing theatres are the Grand and the Royal. The new theatre is in the same street as the Grand, and will be easily accessible to the dwellers in the growing eastern side of the city.

THE foundation-stone of the new Wesleyan chapel and schools at Pump Street, Worcester, was laid on the 21st inst. The new buildings will occupy the site of the old chapel, with a considerable added area, and, fronting the street, will have features of architectural beauty sadly lacking in the old plain brick structure. The total cost is estimated at 8,000*l.*

THE Guardians of St. George, Hanover Square, are about to apply to the Local Government Board for permission to expend 25,160*l.* on alterations and additions to the Fulham Road Workhouse. Within the past twelve months the

Guardians have expended nearly 100,000*l.* on extensions to the infirmary in Fulham Road. A large portion of the new expenditure will be for a new system of steam and hot-water supply and heating apparatus and for the provision of a steam disinfecter.

MR. J. VICKERS EDWARDS, C.E., West Riding County Council surveyor, has reported on the three schemes for widening the county bridge over the Calder at Kirkgate Wakefield. No. 1 scheme, for a steel girder bridge in a straight line from the bottom of Kirkgate to the south end of the existing county bridge, is "not within the range of practical politics." The cost would be 51,337*l.*, and the gradients would be awkward. No. 2 scheme, for widening the present bridge to 50 feet, would cost, say, 32,500*l.* No. 3 scheme, the widening of the bridge on the east or lower side to a similar width of 50 feet as in scheme No. 2, could be very easily effected and would undoubtedly be the cheapest scheme of the three (16,000*l.*). This would involve the rebuilding of the chantry.

VARIETIES.

THE Earl of Hardwicke will open the new Bethnal Green Conservative and Unionist Club, which is being erected at a cost of 4,000*l.*, early next month.

A NEW chapel and school buildings were opened on Saturday in Great Western Street, Moss Side, Manchester; they cost 2,400*l.* for erection.

THE new church of St. Thomas, which the Roman Catholics of Higher Broughton have built in Great Cheetham Street to replace the old building lower down the same road was opened on Sunday last.

THE bascules of the Tower Bridge will be raised for a week, commencing on Monday next from one to five o'clock in the morning, to permit the completion of the painting of the huge structure. The contract for the work is 4,600*l.* The Bridge House Estates committee have approved of the lighting of the Tower, Southwark and Blackfriars bridges by means of a system of high-pressure incandescent gas.

THE annual general meeting of the Glasgow Archaeological Society was held on the 21st inst. in the rooms of the Society, 207 Bath Street. Principal Story presided. The forty-fifth annual report, which was submitted, showed that the number of ordinary members admitted last session to the Society was 17.

VOLUME LXV. OF THE ARCHITECT

Handsomely bound in Cloth, Gilt Lettered, price 12*s.*

Office: Imperial Buildings, Ludgate Circus, E.C.

The office-bearers were all re-elected, and thereafter a paper on "The Laws of Teinds, Oblations and Dues in the Mediaeval Church," was read by the Right Rev. Dr. Bishop Dowden.

THE Hull Queen's Memorial committee have had before them designs for the statue of Queen Victoria, to be placed in the Hull City Square. The joint production of Mr. H. C. Fehr, sculptor, and Mr. J. S. Gibson, architect, London, met with general acceptance, and was chosen. The cost of this statue, apart from the foundations, is estimated at 2,700*l.*, and 500*l.* is still required for the completion of the memorial. The total height of the monument from the street level will be 30 feet, and it will cover at its base 25 feet by 20 feet.

THE Thornton-Pickard Manufacturing Company, of Altrincham, announce that the judging of the photographs received for entry in their recent competition has been completed, and that cheques have been sent to the prize winners. That the popularity of the competition is increasing is proved by the greater number of entries, whilst the difficulty experienced in awarding the prizes shows that the general standard of work is more uniform than that sent in for previous competitions. The present competition was divided into three classes, in each of which five prizes were awarded, and the winner of the first prize in each class, respectively, was as follows:—For photographs taken with the Thornton-Pickard camera and shutter—First prize, 15*l.*, André Callier, 88 Chaussée de Courtrai, Ghent, Belgium. For photographs taken with the Thornton-Pickard focal plane shutter—First prize, 15*l.*, W. F. Brown, 180 Willis Street, Wellington, N.Z. For photographs taken with the Thornton-Pickard time and instantaneous and snap-shot shutters—First prize, 15*l.*, Misses Ella and Agnes Tomlinson, Fishbourne, Chichester. A new competition is being organised for 1902 under somewhat different conditions.

THE usual fortnightly meeting of the Glasgow Technical College Architectural Craftsmen's Society was held on Friday, 22nd inst., Mr. Jas. McKissack in the chair, when a paper entitled "Foreign Competition in the Building Trades" was read by Mr. Geo. Herbertson, measurer. The essayist held that the restrictions put by the combined action of workmen on the importation of foreign-made joinery, finishings and the like, was contrary to the spirit of free trade which is the policy of this country. He suggested that for rolled steel beams and Portland cement a certain standard should be specified, and let the material come from where it might. He deprecated the proposed boycotting by slate quarry masters in their attempt to keep out foreign slates. The paper proved to be of

exceptional interest, and was treated in a manner calculated to dispel any tendency to narrow views on the subject. A hearty discussion followed, opened by Mr. John Fairweather, and the thanks of the meeting were cordially conveyed to the lecturer.

ELECTRIC NOTES.

THE electric-lighting committee of Edinburgh Town Council have recommended that application be made to the Secretary for Scotland for power to borrow 90,000*l.* for the execution of capital works under the Electric Lighting Order, 1891. The same committee had intimated to them that from October 18 to November 21 application had been made for supply amounting in all to 6,495 eight candle-power lamps. There were 2,533 applications for lighting, 3,042 for motive power and 920 for heating.

AT a meeting of electrical contractors held in Leeds on the 23rd inst. it was decided to form a northern section of the National Association of Electrical Contractors, with the objects of the enlightenment of the general public on electrical matters, the raising the status of the skilled electrician, and the advancement of trade interests generally. Discussion ensued upon the best means to strengthen the hands of British manufacturers in their competition with foreign monopolies and trusts, and on the trading of municipalities with foreign firms. It was decided to hold a further meeting in Manchester in January.

THE AUCTIONEERS' INSTITUTE.

A LARGELY-ATTENDED meeting of the auctioneers of Hants, Wilts and Dorset was held at the Junction Hotel, Eastleigh, with the object of forming a branch of the Institute for the district. Amongst those present were Messrs. W. Bennett Rogers, the president (London); Mr. Roland Peck, past-president (London); A. W. Brackett, member of Council (Tunbridge Wells); A. A. Burnett, member of Council (Southampton); E. Bance, D.L. (Southampton); E. Hill (Portsmouth), G. A. Smith (Winchester), Wm. Harris (Winchester), E. H. Carper (Southsea), J. H. Drewitt (Fareham), A. G. Fox (Bournemouth), A. G. Pratt (Bournemouth), W. Burrough Hill (Southampton), P. Shenton (Winchester), A. E. Field (Southsea), T. Miell (Southampton), E. C. Gale (Lee-on-Solent), E. A. Scammell (Eastleigh), R. L. Badcock (Lymington), A. Osmond (Southampton), and Charles Harris, secretary

THE CUNDALL PATENT OIL ENGINE

COPY OF LETTER.

THE GREAT WESTERN HOTEL,

OBAN: October 29, 1900.

DEAR SIRS,—I have very great pleasure in testifying to the efficiency of the 20 B.H.P. Oil Engine which you supplied for driving the Dynamo, which gives current of equal H.P. for lighting and Motors in the Hotel. The Engine has now been in use almost daily for over three months, without the slightest hitch. It gives the utmost satisfaction and the most favourable results.

Practical men who have seen the Engine working pronounce it to be the best and smoothest working they have seen.

What I think is one of the features of your Engine is that any man can start it without any assistance. Most Oil Engines I have seen were difficult to start, taking three, four, and sometimes six men to start them.—I am, yours faithfully,

ALEX. MCGREGOR.

R. CUNDALL & SONS, LTD. SHIPLEY, YORKS.

London Office—20 & 22 St. Bride Street, E.C.

Paris Office—5 Rue Gozlin.

(London). At lunch Mr. Burnett presided, and the loyal toasts were proposed and duly honoured.

The Chairman then proposed the health of the President, who, in reply, said it was a great pleasure to him to pay them a visit, as he held the highest opinion of these local branches, as he had proved their utility upon many occasions. The Institute was steadily growing in numbers and in the estimation of the public generally. In view of what had been said, he wished to reiterate that the greatest care was taken by the Council in the selection of members, and as regards the younger men, they all knew they had to undergo a searching examination. In that connection he would just say what pleasure it had given him a few days ago to present the first gold medal for merit at the final examination. The Council were engaged upon the application which they hoped shortly to make for a royal charter, and he felt sure the obtaining of this would add to their standing and position before the general public.

Mr. W. Roland Peck proposed the "Health of Mr. Burnett," who replied, and the business of the meeting was proceeded with under the presidency of Mr. Rogers.

The Secretary (Mr. Chas. Harris) having read the by-laws of provincial branches, Mr. Ernest Hall moved that a branch be formed and that it be called the Hants, Wilts and Dorset Branch. This was seconded by Mr. A. Field and unanimously agreed to.

Mr. Edward Bance said that as one of the original members of the Institute he must congratulate his fellow-auctioneers upon meeting together for the purpose of inaugurating this branch. The Institute was going in the right direction, and these branches would get it better recognised in various parts of the country.

Mr. A. W. Brackett gave an account of the formation of the Kent, Surrey and Sussex Branch, and said that, as a member of the Council, he could testify to the incalculable benefit these branches were to the parent Institute. The following provisional committee of the new branch was then elected:—For Southampton, Messrs. E. Bance, A. A. Burnett, W. Perkins; for Portsmouth, Messrs. Ernest Hall and G. E. Kent; for the Isle of Wight, Messrs. F. Pittis and H. J. Way; Salisbury, Mr. J. T. Woolley; Winchester, Mr. W. Harris; Bournemouth, Mr. A. G. Pratt; Dorchester, Mr. T. H. Enson; Basingstoke, Mr. W. A. Simmons.

The meeting terminated with a hearty vote of thanks to the President.

HOVE PARISH CHURCH.

ON All Saints Day the Bishop of Chichester consecrated the eastern portion of the new parish church of the borough of Hove. This marks the completion, says the *Guardian*, of the body of one of the largest and finest modern churches in the South, or indeed in any part of England. There still remain to be built the tower and the western narthex; but the interior, with the exception of the south-west corner where the tower will stand, is complete so far as the shell is concerned, though much is lacking in the way of furniture and decoration. To the student of modern architecture this church offers many points of interest. It was designed by the late Mr. J. L. Pearson, R.A., but does not present the features that we most commonly associate with his name. The series of great town churches which are the most characteristic productions of his genius have certain easily recognisable features which mark his style. They are generally groined throughout, and the groining is carried on a multiplicity of piers of light and elegant form, which afford to the spectator as he moves a series of ever-changing vistas. The proportions of the nave are narrow and lofty, and where width is desired the aisles are doubled. Tracery is sparingly used, and the details generally reflect the character of the early part of the thirteenth century. The choice of materials was necessarily governed by considerations of cost. These have generally led to the use of brick for the walls, with a sparing use of stone in dressings. But the inferior material has been so skilfully employed that what was in its essence a stone style has gained an added beauty by its use in connection with brick.

In the new church at Hove most of these characteristic features disappear. In the first place, the generosity of the founders of the church has made it possible to use stone throughout, and the adoption of a later style of architecture has led to the introduction of traceried windows on an extensive scale. Stone groining is sparingly used, being confined to the sanctuary, the baptistery and the south chapel dedicated to the Holy Ghost. In the place of groining, the nave and aisles are spanned by great stone arches, those over the nave rising to the height of 58 feet at the apex. The advantage of this arrangement is that, while much of the monumental effect of groining is preserved, great additional height is gained, no little advantage in a church with a nave 35 feet wide and an extreme width between the outer walls of 80 feet. Moreover,

oak roofs appearing between the arches give a pleasing variety of colouring, which is lacking in a church that is lined in stone throughout. The arcades, which are lofty and finely pointed, together with the windows and doorways, are elaborately moulded. We know of no modern church in England where the mouldings have been so elaborated. The design of the nave is continued in the chancel, except that the responds which carry the cross arches are advanced a little so as to reduce the apparent width, while in the sanctuary the width is further reduced and the apparent height greatly increased, there is greater richness in detail. The extreme length of the nave is 162 feet. The general effect is that of an unusually lofty and spacious church, with great solidity in the walls and piers, which produces in a spectator a sense of personal significance which is not often felt in a church under cathedral scale. The exterior appears less complete than the interior, the absence of a tower being keenly felt and the folding is not yet cleared from the east end. But the south transept presents a fine elevation, the five-light window in the north transept being particularly noticeable. In addition to the choir and priests' vestries, there is a large parish room contained within the building, and another room in the north transept, as well as lavatories and verger's room. The cost has been about 42,000*l.*, and the work is being carried out under the superintendence of Mr. F. L. Pearson, son of the original architect.

KING SOLOMON'S WELLS.

The following extract from a letter from Jerusalem, dated October 21, appears in the *Jewish Chronicle*:—"When I returned from Tiberias I found that the engineers had made great progress in laying the iron pipes to convey the water from Solomon's Pools to the city of Jerusalem. In one place near the north end of the Plain of Rephaim they found that the engineers in Solomon's day had resorted to the expedient of tunnelling the hill, in order to avoid a circuit round the shoulder of the hill of at least one and a half mile. This was a good idea, so the present engineers thought to make a kind of reservoir where during the night the water could accumulate, whence it would derive power to force itself into the city. The tunnel is very confined, measuring on an average 20 inches in height and in width about 20 inches, the bottom being cemented and forming a trough through

which the water used to flow. This bottom was to be cut down to a depth of 6 feet, and then the bottom and sides to be cemented and the ends closed up, except where the pipes were inserted to conduct the water into and out of this tunnel. As this tunnel was thus thrown open for the first time since it was vacated by Solomon's workmen, it created a good deal of interest and drew the people there to see it, and brought to light the very interesting fact that as the workmen of Solomon wrought they in some parts pierced the solid rock, and that they did not, therefore, need to provide a ceiling. Elsewhere, where it was not quite solid, they laid across the gap flat slabs sufficient to prevent anything falling into the water; again, in other places there was considerable pressure from above, and some means must be devised to resist this pressure, so the earliest idea of the arch had been resorted to; two slabs were reared on end, and on either parapet the tops were made to butt against each other thus, *Λ*, as was also the case between the sealed fountain and the pools. And lastly, the startling discovery was made that in one place where the pressure was the greatest because of the loose earth, the knowledge and use of a perfect arch, 12 feet long, was introduced. Probably this just-discovered arch is the oldest arch in the world, and possibly the use of the arch may have been discovered here, though the arch has generally been attributed to the Romans. There were small niches for the workmen's lamps, and the smoke therefrom was seen as clearly as though it had only been left yesterday."

THE INSTITUTE OF BUILDERS.

THERE was a large attendance of the members of the Institute of Builders in the drawing-room of St. James's Hall, Piccadilly, on Wednesday, the 20th inst. Representatives of the architectural, engineering and surveying professions were present. Mr. Charles Wall (president) occupied the chair.

Mr. Woodman Hill gave a lecture (illustrated), entitled "Submarine Construction by Diving and other Compressed Air Methods, Cylinder Sinking and Tunnelling under Compressed Air."

After briefly tracing the development of diving from the days of Aristotle to the time of the open helmet dress, first constructed in 1830, in the employment of which the lecturer subsequently had actual personal experience, he minutely described and illustrated the modern appliances used for

THE MAY-OATWAY FIRE ALARM

Licensed by H.M. Postmaster-General.

No greater fire loss than 10 has ever happened in any building protected by this system, and no one has ever been injured or lost. Whether the premises are occupied or not it is impossible for any fire to burn for more than a few seconds without giving its own alarm, and that at a period early enough to insure its suppression by half a dozen buckets of water. Approved by every Tariff Insurance Office and Fire Brigade in New Zealand, and solely used by the Government of that Colony for the protection of national property where the lives of inmates are concerned.

diving, the various circumstances under which diving operations are undertaken, and gave valuable information as to the depths at which they are practically possible, and the type of men which is suitable for this class of work. He also referred to the attempts made to use artificial light under water, to the expedients used for establishing efficient communication between the diver and the surface, and to the great improvements made in this respect after the introduction and perfection of electrical appliances, improvements which would have been impossible without them. A complete modern diving-dress and helmet fitted with a telephone apparatus, and also a relic of former days in the shape of an original open helmet made by Deane, was to be seen in the lecture-room.

The advantages and disadvantages of bellwork were then next discussed and compared with the work of the individual diver, illustrations of actual works accomplished by both systems being given and explained. These were notably the building of the foundations for the Spithead forts, the construction of the foundations for the circular heads of the defensive harbour at Portland now in progress, and a typical example of a sea wall of concrete blocks founded on concrete in bags.

Works constructed of concrete blocks weighing 30 to 40 tons apiece, and the positions in which they are necessarily and successfully employed, were next dealt with, and the respective merits of staging with steam winches and of Titan travellers compared, illustrations being given of the staging, travellers, and bells employed in the construction of the various piers and breakwaters at Folkestone and Dover, and of a Titan traveller employed on a Russian breakwater, and the Titan setting the last block of the detached Mole at Gibraltar.

The chapter dealing with this branch of submarine work was concluded by referring to the construction of piers and breakwaters in the open sea by means of concrete in mass deposited in casings or large bags, almost all examples of which have proved unsatisfactory, Mr. Hill giving it as his opinion that, to construct submarine foundations in mass concrete successfully, would require it to contain so large a proportion of cement, that the work would be as expensive as building with concrete blocks in which the ordinary proportions of materials were used, and always more risky to execute.

Reference was then made to the rectification and deepening of the Channel at the entrance to the Hamoaze at Devonport, which was entrusted to and has been executed by the speaker's firm, and which necessitated the removal of portions of shoals

covering in the aggregate an area of more than 30 acres, depths of which varied from a few inches to 20 feet, and consisted almost entirely of limestone and shillet rock. drilling barges, boring appliances used in a bell worked compressed air, and dredgers which were specially designed and constructed for the work were illustrated, but only briefly described, as not coming within the scope of a paper on construction.

What may be described as land works requiring the employment of compressed air, on account of more or less elevation of water through the strata to be dealt with, were briefly entered into, and the methods of cylinder sinking, compressed air process, and the employment of these methods in dockwork and continuous quay wallwork abroad explained and illustrated. The instances mentioned were the construction of the foundations of the harbour of La Pallice at La Rochelle in France, the wharf walls in the Garonne at Bordeaux, and also dockwork on a large scale at Genoa. The author pressed his opinion that foreign engineers were much in advance of English ones in the employment of these methods.

Reference was then made to the dockworks at Keyhole where a portion of the main outer sea wall is being built of concrete columns sunk to the depth necessary to secure a foundation by novel and interesting methods. The lecturer concluded his paper by speaking generally but briefly of the methods he described as horizontal cylinder driving or tunnelling, compressed air methods, as found necessary in the gravel and sandy portions of the City and South London Railway, Waterloo and City Railway, the Tower Subway, and also in connection with the completed Blackwall Tunnel, which he described as the finest work of the kind in existence.

A vote of thanks, moved by Mr. T. F. Rider, seconded by Mr. John Greenwood, was passed to the reader of the paper.

THE WIDENING OF PICCADILLY.

The improvements committee of the London County Council presented on Tuesday a further report on the proposed widening of Piccadilly at the Green Park, and will recommend the Council to accept an amended scheme, under which the widening will take effect only from Hyde Park Corner to Grosvenor Street, instead of being carried on to Walsingham House, as first proposed.

NEWGATE ST. LONDON, E.C.

The committee state that they have had a conference with Akers-Douglas and Viscount Esher, and have urged the First Commissioner to permit the Council to carry out the complete scheme, which was initiated by him, twice approved by the Council, and strongly supported by the City of Westminster Council and the Chief Commissioner of Police. The committee have since received the following letter from the Secretary of the Office of Works:—

"H.M. Office of Works, November 18, 1901.

Sir,—I am directed by the First Commissioner of Works to desire that you will express his thanks for the generous opinion which was accorded him by the improvement committee of the London County Council a few days ago. The First Commissioner is aware of the trouble and inconvenience caused to the London County Council by his inability, in face of the strong expression of opinion manifested after the scheme of widening Piccadilly had been laid before the public, to sanction the work, as originally agreed upon, to proceed. The First Commissioner does not think himself justified in recommending that a portion of a park over which the public have certain privileges should be thrown into the street, however desirable upon general grounds, without a consensus of opinion favourable to the scheme, unless a necessity is fully proved; but he is of opinion that, in view of the statement made by the Commissioner of Police in the letter of which a copy is enclosed, and of the concurrence of all those who have specially examined the subject, whose opinions are of great weight, he is fully justified in recommending, on his responsibility as a Minister of the Crown, the issue of a royal warrant to enable that portion of the scheme dealing with the widening of Piccadilly between Hyde Park Corner and a point opposite to or a little to the east of Down Street to be taken in hand. The First Commissioner therefore begs to forward an amended plan for the consideration of the London County Council, showing the limits of the scheme thus amended. It is substantially the same as that already sanctioned by the London County Council within the points mentioned; but he would suggest that the red line to the south be drawn as a line within which liberty of deviation be admissible, and that the ultimate width of the street should be settled between the engineer of the London County Council and the officers of this Department. The First Commissioner makes this suggestion in view of the probability that the exact limits of the plan originally proposed, when a full widening of the whole thoroughfare was contemplated, may not accord for

practical reasons with a curtailment of the plan. This can only be ascertained after a careful marking out of the ground, and the First Commissioner is anxious to interpose no further delay. Should the London County Council consent, in spite of the action which the First Commissioner has thought it his duty to take, to assist him in carrying out the scheme, no obstacles will arise to prevent the work, as soon as the London County Council are prepared to undertake it, from proceeding.—I am, Sir, your obedient servant, (signed) ESHER.—The Clerk to the London County Council." With his letter Lord Esher enclosed the following communication from the Commissioner of Police:—"Metropolitan Police, October 28, 1901. Dear Mr. Akers-Douglas,—I have carefully considered the point you mentioned to me on Friday in connection with the proposal to widen Piccadilly, and we are decidedly of opinion that it will be advantageous to vehicular traffic if Piccadilly could be widened from a point opposite to or a little to the east of Down Street to the end of the Park at the top of Constitution Hill. The block of traffic at the bottom of Hamilton Place has always been a great trouble, and now that it has been to some extent ameliorated by keeping the omnibuses going east in the centre of the road, the necessity for more space at that particular spot is very evident.

(Signed) E. R. C. BRADFORD."

After submitting the letters to the Council, the committee's report states that if the modified scheme now suggested be carried out, the arrangements contemplated in regard to the trees will remain unaltered. These arrangements were that seven trees should be transplanted, eight cut down, and forty-two left untouched, out of the fifty-seven trees affected by the improvement, while nearly twenty new trees were to be planted on the new footway near Hyde Park Corner. The estimated cost of the reduced scheme is £13,536, as compared with the £30,000 already voted by the Council for carrying out the original plan, which vote it is now proposed to cancel. Two months will be occupied in doing the work required by the reduced scheme. The recommendations were approved by the Council.

BUILDING WORKMEN.

AN interesting letter has been received by the *Times* from a working joiner in the North of England, who relates his experiences in the building trade. This is the brief account of his career which he asks thoughtful people carefully to consider.

In the first place, I enter a shop as improver and am supposed to know nothing, or a little less, to start with, and after a few hours I am politely told that I must join the union or decamp. I object to certain clauses as to a standard rate of wages and other details, but, nevertheless, I am either to accept the situation or seek a "fresh shop." Circumstances are against me; I am compelled to accept the inevitable. Time passes on, and a master gives me sixty doors to frame and panel; my mate on the next bench has a similar number; the amount of labour involved, the style and size are equal. Now mine are sent down to the storeroom at the rate of 2s. per door, while my neighbour's are costing 4s. per door. Now this is the signal for a general boycott for me. I am scandalised the whole length of the shop; called a "sweater," a "master's man," and lo! be it said, there is no depth too low and no trick too mean for my shopmates to stoop to in order that I may by any means whatever be ousted from my post of labour. I hold to my post and eventually I rise to take the highest post possible in the same shop, that of staircase building and handrailing, and now things assume a different aspect altogether. I am told by my shopmates that I am a fool for studying and persevering in my pursuit of knowledge, and more particularly so since that for this advanced and arduous labour, in our part, I can demand not $\frac{1}{4}$ d. per hour above the standard rate of wages, and the man who cannot manage even to make an ordinary frame and sash can demand the same. Now, what is the reason of this? I am told "that for my work I am paid the standard rate of wages; what more do I want?" Now, sir, may I ask, where is there any incentive to advancement? To what purpose should I think or study for the benefit achieved? I must confess that to a man whose mind is dull and unfertilised there is none. And this cry is heard up and down the land.

Unavoidable circumstances compel me to leave this scene of labour, and the first shop I enter in my new sphere and commence to work, believe me, sir, I am not allowed to work one hour before I am approached and ask if I intend to work all day long at this "racket." To this inquiry I replied by asking whether I was not doing sufficient, and I am quickly told "Yes; too much by one-half." Here I am called a "fool" and a "pacemaker," and pressure is brought to bear with a view to limiting my output, the chief cause for this being "that if I continue to assert my individuality the boss would expect all the men in the shop to do the same." I need not say that my stay in this shop was of short duration. I enter

another shop, and at the close of my first day's lab. I am surrounded by my fellow-workmen and told again that I was a fool for doing so much in one day, and that the job I had done should at least have lasted me three days. It could be bought in any town in England for a paltry 16s., and yet to the mind of a knowing unionist ought to have lasted me three days, and for which my master must have paid in wages alone 17. 0s. 3d. If such things as these have mentioned do not tend to limit a man's output, would you call it? It may be argued that this is an isolated case, but I would remind my objectors that a multitude is made up of individual units, and also that there are hundreds of men whose morals are pure, whose intentions are honest, who are positively ashamed to leave their work on a night, and in the heart of hearts are thoroughly disgusted with the state of affairs altogether. They know, and that only too well, "though they are powerless to relieve it," that, so far as labour in connection with the building trade is concerned, the State of Denmark is rotten to the core.

Mr. W. Emerson also writes:—

The details of the working of the labour unions, and the principles guiding the workmen that have been explained and discussed in your columns can, if correct, cause only a feeling of intense sadness in the minds of thinking persons.

It is not the fact only of the increase of cost to the ratepayers and the community in all public and private works or the way in which the union principles of labour may be upon the poor by the increased rents they must have to pay for their housing, if the guiding principle during construction has been not the most and best a man can do, but the vilest possible for the money earned. But there is a far more serious question, and that is the necessary demoralisation of the workmen themselves caused by such action. No man can pervert and bastardise the powers and energy with which he has been endowed by working in a way which "sacrifices time, talent, labour, honour, principle and life at the altar of mammon," as seems to be encouraged by the trade unions, if the accounts in your columns are true, with the worst moral deterioration; and as this principle appears to govern not only the building trade but most, if not all, other branches of British labour, it must affect the bulk of the work masses—in other words, the bulk of the British nation is being demoralised by means of an organised system.

If this goes on and better influences do not prevail, how will this moral deterioration affect our country if in some future

we find our nation face to face with adversity, or some great national peril?

May Heaven help us then.

But there seem many signs that the best men are getting tired of a system which restricts the diligent and earnest workers to the output and level of the worst and most incompetent amongst them.

LIGHTING AND WATER SUPPLY IN GLASGOW.

On Saturday, the 23rd inst., in different districts of the city lectures were delivered by officials of the Corporation on the water and gas supply of the city.

In the public hall, Maryhill, Mr. Robert Wilson, treasurer of the Water Department, lectured on "The Waterworks of Glasgow, Past and Present." He began, says the *Glasgow Herald*, by giving a brief historical sketch of the water supply of Glasgow since the beginning of last century. Prior to 1804 Glasgow, he said, had to depend on public wells for the supply of water. The population was 92,000, and there were only one thirty public wells, but of course there were a good number of private wells. In that year an enterprising citizen started waterworks, and drove large barrels of water through the streets, for which he got a ready sale. In fact, the demand for the water was so great that it was estimated the adventure yielded him about 4,000*l.* per annum. He also fitted up hot and cold-water baths in Bath Street, from which the street derived its name. The water in some of the wells was not safe to use, and at many of the wells could only be obtained at great inconvenience, as they were only open at certain hours, and people had to wait their turn. Various attempts were made at that period by the magistrates to get a better supply, and in 1806 the Glasgow Water Company was formed and power granted from Parliament to get a supply of water from the Clyde. In 1806 a rival company was started; but in 1838 both companies amalgamated, and the Glasgow Water Company supplied the city themselves. Mr. Wilson then traced the gradual growth of the works and the means adopted to supply the best possible water, after which he referred to the great opposition and expenses incurred before the Loch Katrine water was introduced in the year 1859. Her late Majesty Queen Victoria performed the opening ceremony on October 14, 1859, and in March 1860 the supply was general

over the whole city, and the engines at Dalmarnock were stopped. The lecturer then took his audience (by the aid of limelight views) to visit the Gorbals Works and Loch Katrine Works, showing the various lochs from which the water is obtained, the sluices at Loch Katrine, the old and new aqueducts, aqueduct bridges, reservoirs, &c., showing the great skill and expense entailed in carrying out these undertakings. The total length of the new aqueduct was 23½ miles, and the cost of the tunnel through the rocks was from 27,000*l.* to 30,000*l.* per mile. The first aqueduct opened in 1859 was 8 feet wide and 8 feet high; the second, opened in June last by the Lord Provost, was 12 feet wide and 9 feet high. Both aqueducts combined would be capable of conveying 110,000,000 gallons per day when that quantity was required. If Loch Katrine and Loch Arklet were not able to supply that quantity, then additional water could be brought into Loch Katrine from the adjoining valley of Loch Voil and Loch Doine; 110,000,000 gallons would fill a canal 30 feet wide and 6 feet deep for nearly 19 miles. The area of distribution extended from Mount Vernon on the east to the outskirts of Renfrew on the west, a distance of 11 miles, and from Milngavie on the north to Barrhead on the south, a distance of 15 miles. The total cost of the works to date was 3,907,578*l.*, of which about 1,300,000*l.* had been spent in the new reservoir and aqueduct works. The debt was being paid off by sinking funds, and 1,075,628*l.* had since 1870 been wiped out. The population supplied at present was 1,057,833, and the average quantity of water supplied last year was 56,345,000 gallons per day, equal to 53½ gallons per head per day. The revenue drawn last year was 216,512*l.* The domestic rate, which at one time was 1*s.* 4*d.* per 1*l.* within the city, was now 5*d.* Supplies by meter had been reduced from 1*s.* per 1,000 gallons to 4*d.*; thus hundreds of thousands of pounds had been saved to the citizens through the reductions in rates. He concluded by paying a warm tribute of honour to those men who forty years ago, in face of great difficulties and in spite of strenuous opposition, carried through to a successful issue the Loch Katrine Waterworks. The lecturer received a cordial vote of thanks.

Mr. Alexander Wilson, manager, Dawsholm Gasworks, delivered his lecture in Pollokshields Public Hall. Treasurer Murray presided. Mr. Wilson began by referring to the time when, little more than a hundred years ago, Murdoch made his wonderful discovery as to the value of gas in coal, and when Sir Walter Scott, Sir Humphry Davy, Wallaston, the scientist, and others made merry over Murdoch's seemingly

mad notions. He sketched the early movements for the introduction of gas into our own city. The year 1805 saw the first shop lit by Mr. Lumsden, bookseller, with gas made on the premises. Twelve years later the matter of gas-supply was taken up seriously, and a company was formed with borrowing powers to the extent of 40,000*l.* to light the town and streets with "inflammable air." The holder then built, capable of accommodating 25,000 cubic feet of gas, was the largest in the kingdom. Great was the excitement when the first shop was lit from these works in the year 1818, and on September 5 in the same year Glasgow's first street lamp was lit. That the gas industry made rapid strides in the early days was evident from the following dates and amounts of additional capital required:—1822, 40,000*l.*; 1825, 25,000*l.*; 1826, 50,000*l.*. The first Tradeson works was completed in 1838 at a cost of 20,000*l.*. Five years later the City and Suburban Company fought issues with the old company by erecting Dalmarnock Works. It was in the year 1869 that both companies were absorbed by the Corporation. The great increase in our gas industry since then would be apparent when it was stated that in 1870 the yearly make was but 1,295 millions, whereas last year the make amounted to 6,121 million cubic feet of gas. During that period the gross revenue had risen from 235,700*l.* to 870,000*l.*. Dawsholm Works, the largest of our stations now in operation, contains 2,112 retorts, and during last year 300,000 tons of coal were carbonised. Over 1,000 men are employed at Dawsholm in the winter months, and the wages bill for the year amounts to 62,000*l.*. To meet the increasing demands new works are being presently erected at Provan, on the lands of Easter Blochairn, and a portion of Blackhill and Germiston estates. These new works when completed will cover an area of 131 acres. There will be four distinct sections, each capable of producing 12 million cubic feet per day. The lecturer then gave an interesting description of the different processes of gas-making. In conclusion, Mr. Wilson said that gas, although one of the most useful necessities of modern life, and supplied at a low cost, was used and paid for generally in anything but a thankful spirit. Most people had the idea that payment of gas bills was on the same level with payment of taxes. This idea seemed to have got crystallised into the mind of the public, and no doubt accounted in a large measure for the indifferent treatment which gas often receives. If gas had to be bought at a shop like any other household commodity and carried home for consumption, and a fresh supply procured as

soon as the stock ran low, what a different value would be upon it. If gas consumers would only bring the same amount of common sense to bear on the use of gas by trying to get value out of it, as they did with the other commodities, they would save money and have much better lighting. The lecturer demonstrated his contention by an exhibition of dull, dim light procurable from the flat-flame burners as compared with the splendid illuminations to be obtained by the use of incandescent burners and mantles. Reference to public lighting, Mr. Wilson said great advances had been made, but that little evidence of this was to be seen coming as yet in Scotland. Glasgow, one of the most advanced cities in many respects, was far behind in the matter of street lighting. One of the engineers at a recent congress said that the lighting of Glasgow streets was deplorable, and described the means employed as a lot of lights and flickering blue-bottles. Other cities in England and especially abroad, were taking full advantage of the improved methods of street lighting, but the authorities in Glasgow seemed content with some experiments in the streets, using in most cases old, out-of-date lanterns, which were quite unsuitable for the modern system of lighting.

On the Continent, with gas from eight to twelve candle power, the streets in the largest towns were brilliantly lighted by the incandescent gas system. In one district alone in the south of London over 17,000 out of a total of 22,000 lamps had been altered within the last few years from flat flame to incandescent lighting, and invariably with properly constructed lanterns, as it was found that a great deal of light was wasted by the old style of lantern. High-power lighting similar to that used in the Exhibition grounds had been adopted for many of the principal thoroughfares, crossings and bridges, and was giving much satisfaction, the places especially mentioned in this connection being Liverpool, Sheffield and Newcastle. The lecturer also made reference to our public halls. He advised that the decoration of the halls should be arranged so as to assist the lighting, at present in many cases the colours used tend to absorb rather than reflect or diffuse the light. During the lecture over 100 slides were thrown on the screen, and many exhibits were shown of incandescent burners suitable for home, the hall and the street, including the Welsbach and Scott-Snell intensifying burners, the latter mainly being suitable for large buildings and for outside lighting. Mr. Wilson received a vote of thanks for his interesting lecture.

The Architect.

THE WEEK.

So much has been said of late about the advantages to architects from the alliance of provincial societies with the Royal Institute, it was, we suppose, unavoidable that the influence of the organisation on the First Commissioner of Works should be tested. The occasion was not entirely opportune, for it was not to be expected that a Minister, after arriving at a decision by an anxious course of reasoning, should on demand confess that his labour was in vain. Besides, the case selected by the allied societies was somewhat indefinite. It was proposed to entrust the carrying out of the late Mr. BRYDON'S plans for the Government offices to some living architect who was in sympathy with him, but there was not enough courage on the part of those who got up the memorial to name the individual who was contemplated as his *alter ego*. Mr. AKERS-DOUGLAS replied that he did not believe so self-sacrificing an architect was to be easily discovered, and there was common sense for the conclusion. The attempt to exercise control over the Commissioner having failed, architects unfortunately will have to accept the consequences. Hitherto it was possible to believe that an architect, should a dispute arise with a client, had some powerful organisation at his back to uphold him; but it is now apparent to all England that no such protective force exists. An architect must henceforth submit to be regarded as a constituent of a mass that is not valued by men in authority. Already several provincial papers are turning some of the assertions in the memorial into ridicule, and warning their readers against the declaration of the combined architects that "it is only during the execution of his building that the architect himself arrives at the true development of his original conception." Clients will, of course, interpret the words as meaning that they must not assume the commonest building can be properly represented by the plans which the architect prepares, or the quantities which are based on them. Unknown, if fine, developments are to arise for which he will have to pay. That is not a satisfactory result of organisation. The affair will, however, enable presidents of societies to display their eloquence in explaining their courage against the Office of Works, and it will also form an important item in annual reports.

A DECISION which has been given in the Court of Appeal of Montpellier must be ominous for French architects, and we hope will never be adopted in English courts. An architect had claimed 5 per cent. on the cost of the works for the erection of a house which amounted to 163,000 francs, but the defendant refused to pay the percentage on a larger sum than 90,000 francs, the amount of the architect's estimate. The court decided that architects' fees should be based upon the "devis primitif," or original estimate. It was admitted by the judges that it is not possible always to fix the architect to an amount that would be absolutely rigorous, but that the proprietor had the right to demand an approximate valuation of what was to be executed, otherwise the expenses might grow to an amount which would cause much inconvenience or even ruin. The neglect to protest against expenditure was excused, as it was said the proprietor could not well do so during the progress of the works, for if they were stopped he would also suffer inconvenience. But he could not be compelled to pay for an estimate which was incorrect, or for the want of foresight on the part of the architect when planning and making preliminary arrangements. In England it is generally accepted that percentage will be paid on the total outlay, but some public bodies have of late years passed resolutions to the effect that commission will not be allowed on any excess of a prescribed sum, and, of course, a similar arrangement can be entered into by individuals.

READERS of CARLYLE'S "French Revolution" will find in the reproductions of the drawings by JEAN LOUIS

PRIEUR, which are published in the two last numbers of *L'Art*, the most graphic illustrations of the memorable events which have hitherto appeared. Little is known about the artist. He was born in 1759, and was the son of a "ciseleur du roi" or engraver on metal. The young PRIEUR was a political enthusiast, like many artists of the time, and appears to have been closely allied with the terrible FOUQUIER-TINVILLE. He wished to display the history of the Revolution by means of paintings and engravings, and for that purpose made drawings of the events of which he was a spectator. He was one of the judges of the Revolutionary Tribunal, and it was charged against him that he sometimes made caricatures of the accused. His drawings might not in all cases be included in that category, but he certainly sketched the prisoners who came before him. As was to be expected, he shared the fate of other judges and came under the guillotine. His widow offered to the Government a collection of his drawings, and twenty of them were accepted. But somehow those remarkable historic documents have been ignored for a century, and their republication now excites intense interest. One of the characteristics of PRIEUR'S work is the care taken in the representation of buildings, and it is sufficient to warrant the statement that he was an architect. The plates are, however, only a part of the valuable illustrations which appear in each number of *L'Art*. Not satisfied with enriching the public with single numbers which are volumes, the Director has just given the most amazing of his gratuitous "primes," being a large size etching by M. ADOLPHE LALAUZE of a *pastorale* by PETER, and which alone is worth more than the sum charged for a year's subscription. M. PAUL LEROI is to be congratulated on the success which his extraordinary liberality has gained.

It is generally held that competitions of an artistic kind do not suit the German nature. Every artist, whether he is a painter, sculptor or architect, is well taught, and it is, therefore, easy for him to summon up reminiscences of countless works by other artists whenever he attempts to design. But as all the artists who engage in a competition arrive at a conclusion by the same process it is not very probable that there will be much difference between the sketches or models which are produced. This fact is apparent from the large memorials of the campaign of 1870 to be seen in various cities of Germany, and which have a familylikeness which is unmistakable, if monotonous, to a stranger. The same peculiarity was exhibited in the competition for the Wagner memorial, which has just been concluded in Berlin. The character of the great composer was well known to his countrymen, and all his works have been heard in every German town where there is an opera house or even a theatre. WAGNER'S devotion to Germanic myths also appealed to theories of art which are common with German artists, for they were in keeping with the muscular men and women which for many years have been the ideals in all academies and schools of art. Herr EBERLEIN, the sculptor, has been successful, and we presume his model will be executed. To say it is correct in all its parts may seem faint praise, but it cannot be asserted that the artist was favoured by inspiration, and his group does not suggest any new ideas about WAGNER and his works.

It is with regret we announce the death of Mr. C. J. INNOCENT, of Sheffield, which occurred on the 30th ult. Last week it was mentioned that he had taken his son into partnership. Mr. INNOCENT was in his sixty-second year, and since 1862 he has been in practice in his native town. In 1871 he was appointed architect to the local School Board, and about twenty of the schools were erected from his plans. He was also engaged as architect by the Board of Guardians and other public bodies. Mr. INNOCENT served the Sheffield Society of Architects and Surveyors by acting as honorary secretary, and he was elected President a few years ago. Until the time of his illness he was in active practice, and was much respected in Sheffield.

BYZANTINE EGYPTIAN ART.

IN an article entitled "Duality of Egyptian Art," which appeared in *The Architect* of September 6, we endeavoured to explain one remarkable peculiarity of the ancient Egyptians. That was their belief not only in the immortality of the soul, but likewise in the immortality of the body. As the artists were able to lend themselves to the Egyptian anticipations of a return to earth, they were largely employed in the furnishing of tombs. We said:—"The multiplicity of Egyptian works of art was, therefore, indispensable, because they ministered not only to a visible state of existence, but also to one which was veiled to most eyes. The undiscovered country from whose bourne no traveller returns was not recognised by any orthodox Egyptian. The travellers he was assured, came back. Affection might in some cases dictate that provision should be made for their relatives' needs when revisiting the Nile Valley, but every prudent Egyptian took care to be independent of the memories of his children and friends. He made preparations for the reappearances to which he was destined." The preparations to which we referred were mainly of an architectural character, as they would appeal more strongly to our readers. In many of the tombs there were, for example, models of temples or shrines, and in the oldest class of tombs there was sometimes a doorway or a table or some other article which recalled the terrestrial life of the defunct person. The conclusion we came to was "that there was a wider field for artistic labour in Egypt than in any other country, and that the demand for the services of artists arose because, unlike the custom in most other countries, ancient or modern, they had to gratify not only the living, but, as was supposed, the departed Egyptians also."

In the last number of *L'Art* the subject is considered from another point of view by M. A. GAYET, in an article on "La Peinture Byzantine en Egypte." It was only after the Roman occupation that Byzantine influence could be exercised in Egypt. But there is much to prove that the old belief to which we referred in "The Duality of Egyptian Art" was still effectual in spite of the number of centuries which had elapsed and the modifications to which the religion of the people was subjected.

M. GAYET begins with describing the peculiarity of the personality of the "double," which sometimes was believed to animate a figure of wood or stone if it bore more or less resemblance to the subject when he or she lived in Egypt. This credulity, which lasted fifty centuries, had the effect of substituting realism for conventionalism, for we can imagine that the artist would endeavour to produce a faithful likeness in proportion as the heirs, executors and administrators of the departed person were willing to pay for the labour required over details. M. GAYET says that Christianity when it gained a footing in the country was unable to transform the traditional theory of a future life among the Egyptians. There was a simpler form of burial. Embalming was no longer necessary, but the body was enveloped as before in a great number of wrappings fastened by bands. In some districts, if not in all, the face of the corpse was covered with a panel of wood on which was painted a portrait, and a painting of the person was sometimes executed on the outer envelope. In the necropolis of Antinoë a burial-place belonging to one family was found, and in it was a large medallion portrait which was placed near the entrance. One of the corpses was so well preserved it was possible to test the portrait, and the fidelity of the likeness was undeniable. What is also surprising is that the costumes shown in representations bore a resemblance to those which are found depicted in wall-paintings and mosaics at Ravenna, allowance being made for the difference in the character of the figures. In Ravenna we see the emperor, empress, officers of state and courtiers, while in Egypt it was a less exalted class of people who wore the dresses. But in the embroidery and other ornamentation the affinity of the fashions of dress, too, is apparent. It is still more surprising to learn that the treatment of the figures and the colouring are declared by M. GAYET to recall the portraits of the Romantic school in France from the time of DAVID to that of PAUL DELAROCHE.

It is maintained by M. GAYET that the realism of the portraits was due to the primitive belief of occasional re-

appearances, and that the Greeks and Romans when they conquered Egypt adopted the Egyptian customs of burial. Plaster-masks were sometimes substituted for the wooden tablets; occasionally the mask was gilded, but more often it corresponded with the colour of skin. When Christianity gained power the mask was increased in size, so as to cover the chest, and in the case of women garlands of flowers surrounded the head and lay on the shoulders. In course of time the artists were enabled to paint, or rather to model portraits in wax, for in the grave-digging at Antinoë two of the knives have been met with which were used in the process. As it was believed the dead man or woman was in glory in another world, the use of gold became common, and is to be seen not only surrounding the head as a nimbus, but in the representations of jewellery. The costumes were produced with a fidelity which imparts almost as much interest to fashions as can be found in the portraits. One picture shown in *L'Art* is a medallion of about 2 feet diameter, on which we see two men, while behind them are two statuettes apparently of APOLLO and MERCURY. They wear Byzantine robes, and one of the mantles is fastened on the shoulder by a brooch. The type of face is in neither case Egyptian, and M. GAYET thinks they are Oriental Greeks. On one of the robes is a *suastica*. Another painting, which was discovered this year, is a portrait of a woman who holds in one hand a cross of a form which recalls the old Egyptian *ankh*, having a circle above the arms. Ancient Egypt is also suggested by the pattern on the robe. This is one of the most extraordinary paintings in existence, and although in the photographic copy the colours are wanting, we must be struck by the vigour of the execution and the vitality which is expressed.

These Egyptian figures are remarkable because they can be considered as the precursors of the sepulchral images which are found in Mediæval and Renaissance churches. In the European examples so far as we know all that was desired was to preserve a likeness of the person buried in the tomb or in a neighbouring grave. It is only in exceptional cases that portrait-statues were erected during the subject's lifetime, and the Egyptians may therefore be said to have set a fashion which has continued to the present day. Whether in other countries there was an independent incipience of paintings and figures which are faithful portraits is not yet determined. There are, for instance, in the Assyrian sculptures of the British Museum and the Louvre strongly marked types of character. To what extent the royal heads resembled the rulers cannot be ascertained. Some day discoveries may be made which will solve all doubts. It should be remembered that at one time it was generally believed the Egyptian artists produced conventional representations only, but the figures in the tombs have shown that they could likewise express the characteristics of individuals. In consequence there has been a reaction in the theories about art, and the tendency now is towards the belief that one class at least of Egyptian artists were genuine realists, and adhered to the models before them. Another question which must arise on seeing portraits like those found at Antinoë is, to what country did the portrait-painter belong? Were they Egyptians who accepted Byzantine treatment, as in our time the Japanese copy French and English forms, or had a great change at an earlier age occurred in Egyptian art which was developed in Greece and Byzantium, and which therefore at the beginning of our era would not be considered novel in Egypt? Questions like these cannot be now answered with confidence. For the archaeologist there is still corn in Egypt, and all who love antiquity must therefore rejoice that so many reverent experts are engaged in explorations which are likely to increase our knowledge of the ancient Egyptians.

We cannot conclude this article without referring to the interesting experiment which M. GAYET has just tried at Paris. In the Musée Guimet are two mummies which were lately brought by him from Antinoë. One of them is that remains of a girl named THAIS. She was not the love THAIS who, as JOHN DRYDEN said, sat by the side ALEXANDER THE GREAT, "blooming like an Eastern bride" but was a Christian anchorite who lived in the fourth century of our era. The body when found was richly clad, and a rush basket near it was a crown of roses, a palm-branch

and a rose of Jericho as a symbol of immortality. M. GAYET was not satisfied with the possession of the mummy, for he lately resolved that he would show by means of a living model how an Egyptian woman was dressed at the time on ordinary occasions and how she was prepared for the tomb. He was able to obtain the services of a figurante, who at his bidding clothed herself as THAIS may have done 1,500 years ago. The experiment was witnessed by a large number of Parisian ladies, and met with complete success. It proves that the knowledge of antiquity would be popularised if similar attempts were made to show the difference between past and present.

READING ABBEY.*

THE abbey of Reading is devoid of that romance which is associated with Melrose, Tintern, Fountains, Whitby and others, and to that cause must be ascribed the comparatively restricted interest which is taken in it. But the student of history finds more material at Reading on which to reflect than in the majority of similar establishments. This peculiarity arises in part from the extent of the evidence which has survived about transactions of which the abbey was the scene. In an architectural sense there is little of the ancient building to be seen. The hand of the vandal was unsparing, and only occasional stretches of wall remain to carry the mind back to the days when the abbey was an embodiment of ancient art.

The beginning of the construction was undertaken at a time when the massive Norman architecture was being transformed into Early English, and, unlike their Cistercian brethren, the monks were of a class who were not afraid to employ the style in all its beauty. The order of Cluny, or Cluni, that settled at Reading, stands out prominently in the religious life of the Middle Ages. It was one of the many branches of the great Benedictine tree. The abbey of Cluny, near Mâcon, was founded early in the tenth century, and HILDEBRAND, who was afterwards GREGORY VII., was one of the members. The introduction of the Cluniac monks into England arose almost by an accident. While on a journey to Rome WILLIAM of Warren, to whom Lewes and other possessions had been parcelled out by WILLIAM THE CONQUEROR, was forced owing to the robbers to take refuge with his wife in the monastery of Cluny. They were so impressed by the orderliness of the inmates that they prayed the abbot to supply a community for a monastery they were desirous of founding at Lewes. WILLIAM THE CONQUEROR had also offered inducements to the abbot to send over half a dozen of the monks. But the English were looked upon as a barbarous race, ill adapted to receive men of refinement, and it was only after much hesitation that four were despatched to Lewes. WILLIAM of Warren was so proud of the success of the negotiations that on his wife's tombstone he inscribed the remarkable boast that "she introduced into the churches of the English the balm of good manners." In his will the founder expressed a hope that the growth of the monastery would keep pace with the growth of his own family. This injunction was fulfilled, for in 1147 a second dedication took place at Lewes, which was rendered necessary by the large additions that had been made to the original building. The English houses were, however, ruled by Frenchmen, and when HENRY I. founded Reading Abbey seven monks with their Prior were sent over from Cluny, while only a few native brethren came from the monastery of St. Pancras at Lewes, probably to act as interpreters. Four years elapsed before the abbey was ready to be dedicated and receive its charter. As was usually the case, the abbey church was not completed until after the domestic requirements of the community had been attended to. It was consecrated in 1164 by THOMAS A BECKET. HENRY II. was present at the ceremony.

When the monks arrived on the scene Reading was, says Dr. HURRY, "a hamlet of thatched wooden houses, covered with straw and reeds, grouped round a little Saxon church, which, together with some of the cottages, was doubtless demolished in order to make room for the

monastery. There were only thirty homesteads within the burgh at the time of Domesday." We can imagine why Reading was selected as a site, from what Cardinal NEWMAN wrote of the Benedictines generally: "They were not dreamy sentimentalists," he says, "to fall in love with melancholy winds and purling rills, and waterfalls and nodding groves, but their poetry was the poetry of hard work and hard fare, unselfish hearts and charitable hands. They could plough and reap; they could hedge and ditch; they could drain; they could lop; they could carpenter; they could thatch; they could make hurdles for their huts; they could make a road; they could divert or secure the streamlet's bed; they could bridge a torrent. If their grounds are picturesque, if their views are rich, they made them so, and had, we presume, a right to enjoy the work of their own hands. They found a swamp, a moor, a thicket, a rock, and they made an Eden in the wilderness. They destroyed snakes; they extirpated wild cats, wolves, boars, bears; they put to flight or converted rovers, outlaws, robbers. The gloom of the forest departed, and the sun, for the first time since the Deluge, shone upon the moist ground."

There had been an earlier religious house at Reading, for HENRY I. in his charter gave it with two others, which had been "destroyed on account of their sins," as an endowment to his abbey. About 400 years afterwards the same reason was no doubt offered for the dissolution of the abbey. The abbot was then HUGH COOK FARINGDON, who gained the favour of both HENRY VIII. and THOMAS CROMWELL. But the king was fickle, and although the monk was described as "HENRY'S own abbot," he was in 1539 tried in his hall of justice and sentenced to death. The punishment took place at the abbey gateway. Two monks were also executed at the same time. FARINGDON'S treatment was the more remarkable as he was a mitred abbot, and therefore ranked as a baron. By the law of England he should have been tried before Parliament by his peers.

The abbey was regarded as wealthy. HENRY I. contemplated the admission of 200 monks, and the endowments were on a scale that would provide for so large a number. On several occasions money, gold plate and jewels were borrowed by kings. But it is also recorded that the abbot was sometimes in debt. Under HENRY VIII. the revenue was valued at 2,116*l.* 3*s.* 9*d.*, while Westminster was worth 3,997*l.* 6*s.* 4*d.* The abbey was allowed to have a mint, but little is known of the coinage. At the Dissolution an inventory was taken of the plate, which was valuable. But a house that was often visited by English kings and the great officers of State was required to offer its hospitality under costly conditions.

Gold plate to many modern censors will seem to be only accessories to a luxury that could not be considered as altogether suggestive of Christianity. What in our time appears far more interesting are the proofs we possess that the Reading monks were faithful to the ancient command about copying books. The manuscripts in the British Museum and Bodleian Library which were derived from Reading Abbey demonstrate the wide range of the calligraphists. Some reproductions in Dr. HURRY'S book show the style of writing. In the Museum are copies of the Biblical books, as well as commentaries on the Scriptures, histories, treatises on common law and theology, digests of Roman law, hymns, cartularies, chronicles, &c. One manuscript is described as having initials in red and blue, a miniature of the VIRGIN and CHILD with an adoring monk, and a full border with the arms of Reading Abbey. Dr. HURRY tells us that "the famous Rota 'Sumer is icumen in,' which has been described as 'the most remarkable ancient musical composition in existence,' although composed by a North-countryman, probably a Northumbrian, was first written down at Reading Abbey about the year 1225." The following lines from it are familiar:—

Sumer is icumen in,
Lhude sing Cuccu!
Groweth sed, and bloweth med
And springth the wde nu,
Sing Cuccu!

The Bodleian Library also contains several of the Reading manuscripts, and there are a few in the University Library, Cambridge. In one manuscript there is a refer-

* *Reading Abbey.* By Jamieson B. Hurry, M.A., M.D. London: Elliot Stock.

ence to 228 volumes which were possessed by the abbey. It is believed, on the authority of a description of the monastic library at Durham, published by the Surtees Society, that at Reading the books were kept in the cloisters.

Although the remains of the abbey are inadequate to exhibit the arrangements, archaeological research has enabled the plan to be traced out. The grounds are assumed to have been bounded on the north by the existing North Forbury Road, on the east by East Forbury Road, on the south by Holybrook and the river Kennet, and on the west by a line which ran through the present Berkshire seed establishment, the Town Hall, &c., to the junction with the northern boundary. The precincts enclosed about 30 acres and the entrances were by four gateways. The inner gateway still exists, and was restored in 1861 under the direction of Sir GILBERT SCOTT. It was in this building that the manorial court was held, and there the last abbot was tried and condemned. The abbey church was cruciform, with a very long choir. The monks of Cluny had no apprehension of the evil effects of art, for according to MONTALEMBERT, "The churches of the Order, always in the first rank for grandeur and beauty, were generally ornamented with paintings, probably frescoes." The chapter-house measured 79 by 42 feet, and was among the most important in England. The refectory is said by Mr. ALBURY to have measured 168 feet by 38 feet. The dormitory was 150 feet long. There was also a leper-house, a guest-house, a residence house for poor brethren, corresponding with the modern almshouses, an infirmary, workshops and other buildings. After the Dissolution the abbey buildings were converted into a royal palace by HENRY VIII., and it was occupied by EDWARD VI., Queen MARY and ELIZABETH. CHARLES I. lodged in it for a time during the Plague in London, and parts of the buildings were at the same time used by the King's Bench, the Court of Exchequer, and the Court of Augmentation.

It is remarkable, however, that demolition of some of the buildings began as early as 1550, when the abbey was utilised as a quarry. The remains of HENRY I. were cast aside to make room for a stable. Queen ELIZABETH granted the mayor and burgesses the right to dig, take and carry away 200 loads of ragged or free stones for the repair of nineteen ruinous bridges, and the old masonry was employed to mend the streets. In the Civil War the walls remaining were battered and demolished. But the supply of material seemed inexhaustible. In 1754 General CONWAY built a bridge with stones from the abbey. The structure was described by HORACE WALPOLE, his friend, as sublime, being "composed of loose rocks that will appear to have been tumbled together there from the very wreck of the Deluge. One stone is of 14 cwt. It will be worth a hundred of PALLADIO'S bridges, that are only fit to be used in an opera."

In 1835 what was left of the ruins, with some adjacent lands, were sold for 500/, and subsequent purchases enabled the site of the abbey to be secured against all further attempts at vandalism. The abbey, in fact, although only portions of the walls are left, will always be identified with Reading, and will recall the days when the agriculturists, artists and scholars from Cluny served as agents in the civilisation of "Berroc-scyre."

Dr. HURRY'S history is illustrated by views, plans, armorial bearings and copies of manuscripts. It may be taken as a model of its class, and will help to show how the archaeologist's inquiries can supplement the historian's. Whatever may have been the faults ascribed to the monks, they are deserving of kindly consideration on account of their love of architecture. Perhaps they realised that a fine building was a monitor, for as SCHILLER tells us, the temples of ancient Rome continued to be holy to the eye, although the gods were ridiculed and the crimes of emperors were rebuked by the edifices in which they were committed. It was art which preserved man's dignity in times of decadence. It is not to be believed that with noble buildings before them the Mediæval monks could have been so degraded as they are represented. Dr HURRY has collected enough evidence about the monks at Reading to give an idea of their character, and the conclusion must be drawn that they were at least equal to laymen in good conduct. They were not ascetics, but were generous in

their hospitality, and in England we hope that will never be considered a crime. Although the information in Dr. HURRY'S interesting volume relates mainly to Reading, it may be taken as having application to English monastic life in general, and the impartial reader is likely to say that although there may have been shortcomings in the men as in their buildings, both exemplified the progress of development in the Mediæval age.

THE NEW GOVERNMENT BUILDINGS.

THE following correspondence has passed between the Council of the Royal Institute of British Architects and the First Commissioner of Works:—

Royal Institute of British Architects, 9 Conduit Street, Hanover Square, London, W.: November 8, 1901

To the Right Hon. A. Akers-Douglas, M.P., First Commissioner of Works and Public Buildings, Storey's Gate, S.W.

Sir,—The Council of the Royal Institute of British Architects have taken the opportunity of their first meeting of the session to pass a unanimous resolution that representations be respectfully addressed to His Majesty's Government with regard to the present proposal to execute the new Government buildings in Parliament Street from the late J. M. Brydon's designs without the aid of a specially-appointed architect of repute

The Council, with the warm support of the presidents of all the architectural societies in the United Kingdom in alliance with the Royal Institute, whose names are appended as signatories to this letter, venture to express the earnest hope that even at this eleventh hour an architect in sympathy with Mr. Brydon's artistic ideals may be appointed to superintend the erection of this vast building, which, if not very carefully detailed in the spirit in which it was designed, will lose much of the grace with which Mr. Brydon, had he lived, would have clothed it. They would also, with all deference, point out that it is only during the execution of his building that the architect himself arrives at the true development of his original conception, so that, for the successful execution of work of this important character, the inventive genius of a sympathetic colleague of the original designer is essential.

The Council of the Royal Institute of British Architects earnestly and respectfully urge the above considerations upon the attention of His Majesty's Government.

We have the honour to be, sir, your most obedient servants
William Emerson, President Royal Institute of British Architects

Thomas Drew, Kt., President Royal Hibernia Academy (Member of Council, R.I.B.A.)

George C. Ashlin, President Royal Institute of the Architects of Ireland.

F. Marshall, President Sheffield Society of Architects and Surveyors.

S. Perkins Pick, President Leicester and Leicestershire Society of Architects.

Alfred Darbyshire, President Manchester Society of Architects

John James Burnet, President of the Glasgow Institute of Architects.

Frank Caws, President of the Northern Architectural Association.

Frank W. Wills, President Bristol Society of Architects.

Arthur Marshall, President Nottingham Architectural Society.

F. M. Simpson, President Liverpool Architectural Society.

W. H. Bidlake, President Birmingham Architectural Association

Butler Wilson, President Leeds and Yorkshire Architectural Society.

H. G. Luff, President Devon and Exeter Architectural Society.

James P. Bruce, President Dundee Institute of Architectural Science and Art.

C. H. Channon, President York Architectural Society.

Edwin Corbett, President Cardiff, South Wales and Monmouthshire Architects' Society.

Arthur Clyne, President Aberdeen Society of Architects.

H.M. Office of Works, Westminster, S.W.:
November 28, 1901.

Sir,—I am directed by the First Commissioner of His Majesty's Works, &c., to acknowledge the receipt of your letter of the 8th inst., together with a resolution signed by the President of the Royal Institute of British Architects and others; and to say that Mr. Akers-Douglas quite appreciates the point of view of those who would prefer some other method of carrying out Mr. Brydon's work than that upon which has decided.

It was, however, after careful examination, during which none of the considerations now urged were overlooked, that the decision to carry out the designs by the agency of Mr. Henry Tanner, F.R.I.B.A., the principal architect of this department, was arrived at.

I may say frankly that among architects of high repute the First Commissioner failed, after some confidential inquiry, to discover any one sufficiently in sympathy with Mr. Brydon's artistic ideals to subordinate his own inventive genius to that of the original designer.

It appeared to Mr. Akers-Douglas due to the memory of Mr. Brydon that his work should remain intact, and that the designs which he left should be carried out with as little variation as possible. The question as to whether these drawings are in a sufficiently complete state to enable this to be done is one upon which the First Commissioner is aware opinions differ; but he has confidence in the judgment of his technical advisers, and he will be ready to exhibit these drawings to Parliament should his action as a Minister of the Crown be hereafter questioned.—I am, Sir, your obedient servant,

ESHER.

The Secretary, Royal Institute of British Architects,
9 Conduit Street, W.

The following letters have passed between Sir John Aird, M.P., and the First Commissioner of Works:—

37 Great George Street, Westminster, S.W.:

November 27, 1901.

Dear Sir,—As I take a special interest, as a London member, in the new public offices which are to be erected in Westminster, I have noticed the comments which have appeared in the Press lately as to the action taken by you as regards the execution of the late architect's designs.

I think, notwithstanding what you have said in Parliament from time to time, that there must be a good deal of misconception, which it would be desirable to clear up, as to the course which you have decided to follow. I certainly understood that your experienced architects would carefully supervise the faithful execution of Mr. Brydon's plans on the lines of the details indicated by him, for which I have understood he left abundant materials.

Personally I remember the care which you took at the outset in the selection of the architects, and I cannot think that you have now left the matter in the position in which it has been represented to be. I should much like to be able authoritatively to say that there is no ground for the great uneasiness which would appear to be felt in some quarters in reference to this important subject.—Yours faithfully,

Right Hon. A. Akers-Douglas, M.P. JOHN AIRD.

H.M. Office of Works, &c.: Dec. 2, 1901.

My dear Sir John,—I am happy to comply with your request for information as to the course which I have taken with regard to the architect of the new public offices at Westminster.

In order to do this more clearly, it may be best for me to revert to the measures originally adopted by the Government for the selection of architects for the offices in Whitehall and Parliament Street.

With a view to obtain the services of the best professional talent, I requested the Council of the Royal Institute of British Architects to furnish me with a panel of leading architects competent to design large buildings of Classical character, from amongst whom I might make a choice. The architects named in this list were invited to submit to the Government portfolios of drawings of their works, and, as a result, Mr. W. Young and Mr. J. M. Brydon were commissioned to prepare plans for the new War Office and the new offices in Parliament Street respectively.

The designs, having been approved by the Government, were exhibited at the House of Commons and were also reproduced in the architectural and other illustrated newspapers. They were favourably received by Parliament and by the Press. But before final orders were given to proceed with their execution they were submitted for criticism to an advisory committee. This committee, formed to advise me on matters of general design, was composed of the President of the Royal Institute of British Architects, together with Mr. Aston Webb, Sir John Taylor and the two selected architects.

In each case, before tenders for the superstructure were invited, the architect died; but in both instances the designs had been revised by the architects themselves and agreed on, and the general drawings were practically completed.

For the War Office the Government retained the services of Mr. Clyde Young, son of the deceased architect, who had been associated with his father in the preparation of the plans and designs, and appointed him to carry out the work in connection with Sir John Taylor, consulting architect to the Office of Works.

The question of the other block of buildings was less easy. Mr. Brydon left no son or partner to succeed him. It seemed

to the Government to be out of the question to abandon his plans after the large sum already expended on them, and on the foundation works, and if his designs, which are still satisfactory to the Government, are to be carried out they should be executed in their integrity.

I satisfied myself, after careful inquiry, that this object would be best secured by entrusting the execution of the plans to the architects of my own Department.

Fortunately, very abundant materials existed for ascertaining Mr. Brydon's intentions. His executors handed over to the Office of Works complete plans, elevations and sections, to the scale of 10 feet to an inch; also full, careful and clearly drawn half-inch scale details of all the important parts. The work of carrying out these designs was placed in the hands of Mr. Henry Tanner, principal architect to the Department, who is a Fellow of the Royal Institute of British Architects, and the winner of their Tite prize for Classical design in 1878. Thus qualified, Mr. Tanner may fairly claim to have been recognised by that body as possessing talent for sympathetic treatment of the work.

The employment of Mr. Tanner has the great advantage of securing that the building shall be erected with every regard to the requirements of the departments which will occupy it; and for this end not only Mr. Tanner's own great experience in the erection of very large public buildings, but that of Sir John Taylor (who will be in consultation with him) will be available. Such saving of cost as there may be by this arrangement has only weighed with me as a secondary consideration.

It is obviously unfair to speak of this work, as many do, as if it had been handed over to draughtsmen or architectural clerks, or as if the attention of the Office of Works staff would be given to it in the intervals of ordinary official duties. On the contrary, I have made arrangements in the Department to relieve Mr. Tanner of much of his ordinary business; and Mr. Brydon's chief assistant, who prepared a large proportion of these drawings under Mr. Brydon's direction, has been engaged to assist in working out such details as yet have to be made up. I have confidence in the judgment I have formed upon the advice of my professional staff, that this development of the drawings can be faithfully and effectually executed. I shall be prepared to exhibit Mr. Brydon's designs, stamped and signed as being those handed over by his executors, for the information of Parliament and to defend my action if it should be questioned.

As a further guarantee that Mr. Brydon's work shall be respected, I propose that no variations in the external elevations shall be made without the assent of the advisory committee above mentioned, on which Mr. W. Emerson (president of the Royal Institute of British Architects), Mr. Aston Webb and Sir John Taylor will act; and, in the improbable event of any suggestions for such variations being put forward, I will refer them to this committee.

I venture to think that when my action is fairly considered in the light of the full facts it will be held to have been justified.

With your consent, I am sending this correspondence for publication.—Believe me, yours very faithfully,

A. AKERS-DOUGLAS.

Sir John Aird, Bart., M.P.

THE NATIONAL GALLERY.

A LARGE altar-piece, by Luca Signorelli, representing the Virgin crowned by Angels, attended by St. Sebastian and St. Jerome on the left, and Sta. Cristina and St. Nicolas of Bari on the right, with a landscape background representing Lake Trasimene, which was purchased in the summer of this year, has now been placed in the Umbrian Room (No. VI) in the galleries in Trafalgar Square.

A portrait of a young man, signed and dated 1657, by Abraham Ragueneau, portrait-painter and writing master to William III., representing possibly the same individual as painted by Terburg, apparently about twenty years later, in the picture No. 1,399 in the National Gallery, has been purchased and is placed in Room XI. The picture here mentioned is the only known work of this painter.

A small panel, representing the Adoration of the Magi, by Benedetto Bonfiglio, was purchased and placed in the Umbrian Room during the summer.

A painted sketch for a ceiling, by Sir James Thornhill, representing an incident in the life of St. Francis, has been presented to the National Gallery by Mr. Charles W. Dopson, and is hung in Room XIX.

The National Gallery has received, as a bequest from Mrs. Charles Wood, a picture by Paris Bordone, representing the Saviour as the Light of the World; it is hung in the Venetian Room (No. VII.).

NOTES AND COMMENTS.

THE decision of the Court of Appeal in the London and Westminster Bank case, which was delivered on Monday, is not without interest for architects in planning similar buildings in which residential and business parts are combined. The branch bank at 217 and 218 Strand is well known. It consists of an underground basement, the bank on ground floor, and four floors above. For taxation purposes the whole was valued at 3,000£, the gross value being 3,600£. The directors of the bank claimed that they should be charged upon the third and fourth floors alone, and it was maintained that, instead of being taken as one building, it had been arranged in the planning that each floor could have a separate occupation. Undoubtedly there were offices in the occupation of tenants. The fact that a common staircase led to the first, second, third and fourth floors was relied on in support of this view. According to the Customs and Inland Revenue Act, "Every house or tenement which is occupied solely for the purposes of any trade or business, or of any profession or calling by which the occupier seeks a livelihood or profit, shall be exempted from the duties by the said Commissioners upon proof of the facts to their satisfaction, and this exemption shall take effect, although a servant or other person may dwell in such house or tenement for the protection thereof." It was asserted that the exemption from inhabited house duty should apply to the ground floor and basement, first floor and second floor. But as the Divisional Court did not adopt that view there was an appeal. Decisions had been given already in similar cases in which the meaning of a tenement was defined. Lord DAVEY had said there must be a physical division of the house, and in the Scottish courts it was laid down that a tenement means part of a house so structurally divided or separated as to be a distinct property or a distinct subject of lease. Now in the bank building there was a private door between the bank and the staircase of which the manager held the key, and he resided on the third and fourth floors. The private door was, in the opinion of the Master of the Rolls, evidence of a desire that the dwelling-house should be used in connection with the bank. The bank premises accordingly became part of an inhabited house and the appeal was dismissed with costs. It is intended to bring the case before the House of Lords, and owing to its importance it deserves the attention of the highest tribunal in the land.

SUBWAYS are so rarely built in this country, the law respecting them must be somewhat dubious. The Public Health Act prohibits the construction without consent of the urban authority of a vault, arch or cellar under the carriageway of a street, and the authority can alter or pull down such structures. It is, on the other hand, permissible for a person who owns land or property on two sides of a street to carry mains for electric lighting, and it may be for other purposes also, beneath the street. This apparent anomaly was exemplified in an action which the Urban District Council of Walker, in the county of Northumberland, brought against the firm of WIGHAM, RICHARDSON & Co., LTD., and the cross action of the defendants against the plaintiffs. The company owns property on both sides of Fisher Street, in Walker, and in April last, without informing the urban council, they made a subway beneath the roadway with a concrete floor. Seemingly it was intended to lay electrical mains along the floor, but afterwards part of the concrete was removed and the pipes laid in the excavation. The Council gave notice that they had resolved to deal with the subway as they were empowered, and the company then anticipated the destruction by removing the arch and filling the tunnel space with ballast and concrete. The pipes were left. The Council then brought an action claiming the right to deal with the subway, which signified removal of the mains, while the company brought a cross action to restrain the Council from disturbing or injuring their pipes or trespassing on their land beneath the street. Mr. Justice FARWELL, who heard the case, decided that where the pipes were placed could not be considered as part of the floor of the structure, and although a tunnel had existed it could be removed without interfering with them. The Urban Council was, his lordship said, entitled to alter, pull down or otherwise deal

with the tunnel, but they could not interfere with the pipes. In other words, the Council had the right to do what was done already by the company; and in this case authority is therefore only barren, for the company's mains have to be left as they are. The plaintiffs were ordered to pay defendants' costs and defendants plaintiffs' costs, which we suppose is equivalent to each side paying their own costs. It was pointed out by the judge that as the Council were suppliers of electric light, a serious question might hereafter arise as to how far such an authority could use its powers against rival traders.

THE American insurance company which has obtained the corner site lying between the Boulevard des Capucines and the Rue de la Paix, and which consequently faces the Grand Hotel, the Circle Militaire, and the Place de l'Opéra in Paris, have determined to obtain the design for the new offices which are to be erected there by means of a competition. It will be open to all French architects. There is no more unique site available in Paris, and from the extent of the frontage on two sides a grandiose structure will not be out of place. An unsatisfactory building in so important a position would be detrimental to the appearance of one of the most frequented parts of Paris, and on that account there are apprehensions that the existing regulations of the Municipal Council are not sufficiently rigorous to overcome all risks. It is not likely, however, that the American company would fail to rise to their responsibilities, and although an ugly building, if capacious, might be thought good enough for London, we are confident that no attempt will be made to introduce the ultra-American commercial style in Paris.

THE important case which was brought by Messrs. STEWARDS & Co., stone merchants and quarry-owners, of Portland, against the Admiralty, really turned on the meaning of the words "may be required." When the tender was accepted by the Director of Admiralty Works, he used the words "about 2,000,000 tons, or such quantity as may be required, of cap and roach stone." The question was, Did the phrase "may be required" relate to a less quantity than 2,000,000 tons, or a larger quantity? It was contended on the part of the Government that the Admiralty need only take the quantity they required and not the amount that was necessary for the construction of the breakwater, or of any definite portion of the works. There is no doubt the official documents were loosely drawn. But in the consideration given to the case in the House of Lords by the Lord Chancellor and Lords DAVEY, ROBERTSON, SHAND and BRAMPTON, it was treated as if it were a transaction between ordinary individuals. Mr. Justice DAVEY had decided in favour of the contractors, and his judgment was approved in the Court of Appeal; but in the House of Lords it was held that when the Director spoke of "such quantity as may be required" it was to be understood that the Admiralty could at any time cease to draw stone from the heaps belonging to Messrs. STEWARDS & Co. In other words, the plaintiffs were bound to have a supply of 2,000,000 tons available, and within that amount the contractors could take as much or as little as they pleased. Although the argument could not be brought before their lordships, it is well known that the price charged for stone depends generally on the quantities to be taken. The Admiralty, by proposing to take 2,000,000 tons, were able as it were, to obtain a wholesale price, whereas if their intentions were known a much higher retail price should have been quoted. The case should serve as a warning, for it shows the necessity of precision in the phraseology of contracts relating to materials.

CATHEDRAL SERIES—CHICHESTER: EAST END OF LADY CHAPEL
WEST END OF LADY CHAPEL

STAINED GLASS IN ENGLAND SINCE THE GOTHIC REVIVAL.

INCLUDING SOME ACCOUNT OF ECCLESIOLOGICAL PROGRESS, FROM 1860 TO THE PRESENT TIME.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays among The Glories of France," &c.

(Continued from page 341.)

ST. MICHAEL'S, Shoreditch (Mark Street, Paul Street, Finsbury), consecrated St. Bartholomew's Day, August 24, 1865, on which occasion Archbishop Tait, then Bishop of London, came into collision with certain of the more "advanced" clergy of his diocese touching ornaments and vestments, is a most stately church. Not only is it both lofty and long, but extremely spacious, accommodating 1,200 persons—it goes without saying—all on the ground floor. With the adjacent schools, clergy-house, convent and Hospital of St. Mary at the Cross, the joint work of Brooks and Sedding, and which the ecclesiologist should make a point of visiting, it forms a remarkably fine architectural group.

Yellow brick banded and patterned with red is the material

The tracery throughout St. Michael's is of the "plate" kind. Into the great west window, shown in the illustration brick enters to a considerable extent, but the eastern one has its five lancets surmounted by three circles pierced in stone under a containing arch. The effect of both these fine windows is more Italian than English. A rose, likewise exhibiting plate tracery, lights the quasi 'transeptal' south aisle of the chancel.

Both aisles and clerestory have rather small windows of two lights in pairs, those of the former being distributed somewhat erratically, as the visitor to St. Michael's will observe when he gets inside, neither coinciding with the nave arcades nor with one another in the opposite aisles. Only a portion of the narthex which it is in contemplation to extend along the west front, communicating with a cloister which shall surround the quadrangle between the church and the conventual buildings, has as yet been begun. This is the south entrance, the excellence of whose effect is enhanced by the handsome iron gates with which it is furnished. Mr. Brooks's plans likewise included a tall north-western tower and quadrangle spire, the absence of which is of little or no detriment to the church's grand external ensemble, though something more important than the spirelet above noticed is requisite to indicate the church's where-

(James Brooks, Architect, 1863-65.)

of St. Michael's, and its style a mingling of Early English and Decorated, though treated with much freedom.

One feature noticeable, not only here but in the other churches of this group, is the grand mass of roof planned with truly artistic ability; another, the almost total absence of buttresses, the south aisle forming a portion of one side of Mark Street without any environing wall; a third, the unusual dignity imparted to the west front by its flanking turrets into which, as well as the graceful and appropriate spirelet at the junction of the nave and chancel, supplying *pro tanto* the want of a steeple, stone is cleverly mingled with brick. Access to this central belfry—a refreshing feature after the somewhat hackneyed gabled bellcote—is gained by a piquant circular staircase turret on the north side, which, as well as the noble eastern elevation, is worth turning the corner of Mark Street to see.

abouts, flanked as it is by a regiment of tall, gaunt model lodging-houses.

However, the great height which Mr. Brooks gave to the structure enables it to assert itself boldly, and to afford an example of how important such a quality is in a town church.

In style St. Michael's is altogether more developed than the three churches of the group already passed in review, and a first glance at its internal assemblage of parts brings the works of Butterfield to the recollection. At the time of the erection of this church Mr. Jas. Brooks was a member of the congregation at St. Matthias, Stoke Newington, and it is possible that so intimate an acquaintance with the features of that masterpiece may have influenced the architect of St. Michael's.

This is observable in the employment of the narrow western or narthex bay of the nave, the arch of which dies off into a square pier, the remaining five arches formed of one large

chamfered order springing from tall circular columns with simply moulded capitals; in the arrangement of the patterned brickwork above the chancel arch, and by the chancel arch itself, which, composed of two stone ribs apparently about 4 feet apart, and starting from corbels affixed to flat pilaster-like responds, carry a brick arch sustaining the bell-spirelet; and to a certain extent in the instrumenta of the chancel, where the arch opening into either aisle springs from gracefully

upon a stone plinth relieved at intervals by circles inlaid with tiling, it just gives that break in the long perspective that is so desirable, without impeding a view of the ministrants at the high altar.

The reredos has already been noticed in these pages. In the large five-light window above it Messrs. Clayton & Bell have made a commencement of stained glass, and a small but effective specimen of their work executed contemporaneously

ST. AUGUSTINE'S, KILBURN.
(J. L. Pearson, R.A., Architect, 1872-78.)

ST. JOHN EVANGELIST, RED LION SQUARE.
(J. L. Pearson, R.A., Architect, 1875-78.)

arranged shafts, recalling St. Alban's, Holborn. The clerestory, with windows regularly spaced and arranged in pairs, is somewhat low in proportion to the arcade, but the roof, gabled, open to the ridge and devoid of tie-beams, is a great factor in the height of the church.

The separation between nave and chancel is effected by a graceful iron screen. Crested with polished metal, and raised

with the building of the church (*i.e.* between 1863 and 1865) may be seen in the first window of the north aisle.

The number of works in stained glass executed in England during the last forty years is so large, that to treat of them in the narrative form hitherto pursued in these pages would be interminably tedious. It has, therefore, been deemed advisable

to present them in the catalogued form here subjoined, some brief and generalising remarks being made upon the history or architecture of such churches or windows alluded to as are of more than ordinary interest and importance.

WORKS BY MESSRS. CLAYTON & BELL.

St. Paul's Cathedral: West window of either nave aisle; originally by Revs. A. & F. Sutton, but rearranged by Clayton, & Bell about 1873.

Westminster Abbey: Five clerestory windows on south side of choir fixed in the autumn of 1857,* one window in eastern clerestory of south transept, six lancets below rose of north transept (1860), Turle Memorial window in north aisle near organ, central window in triforium of apse, half window near entrance in Poets' Corner, series in chapter-house, Herbert Cowper window in south-west tower, &c.

St. Alban, Wood Street (one of the few specimens of Wren's Gothic): Three windows in apse for Sir G. G. Scott, from whose designs it was added in 1856.

All Hallows Barking: East window (1898).

All Saints, North Peckham: † Series in apse (1895).

St. Andrew, Plaistow: Lancets in apse, several in clerestories, all in aisles, and four lancets at west end, for late Jas. Brooks.

St. Andrew, Wells Street: All in northern clerestory (1860-70), "Te Deum" window at west end, west window of either aisle, ‡ large five-light one in north aisle.

St. Andrew, Westminster: Three central windows of apse for John Oldrid Scott.

St. Augustine, Kilburn: Two tiers of tripled lancets at east end of especial beauty (1872-73), great rose and five lancets below it at west end (1881). Perhaps no church erected in London during the "inventive" phase of the Gothic movement has deserved or won more admiration and notice than this of the late J. L. Pearson, R.A.—a work worthy to rank with some of the noblest of the Middle Ages. The chancel, the first portion completed, was opened in 1872; the nave followed six years later; the tower and spire, one of the finest in the Metropolis, and of which an illustration will be given in the next number, was finished but lately.

Battersea Training College: East window of chapel, under direction of Butterfield (1858).

Christ Church, Albany Street: Series in windows of upper tier (very fine single effigies).

Christ Church, Clapham: § East window (1865) and three westernmost ones of either aisle; remarkable for clearness with which groups are treated in a narrow compass (1870-80).

St. Clement, Barnsbury: Eastern triplet (1865), four large western lancets (1894); both the gift of the founder, Lord Ashcombe, and interesting comparative studies. The church, a dignified Early English structure of red and yellow brick, is by Sir G. G. Scott.

Guards' Chapel, Wellington Barracks: Series for G. E. Street, R.A., in connection with his clever remodelling of that edifice's interior (1879).

Hampstead Parish Church: Several windows, one in north gallery inscribed "In grateful memory of the late Sir Gilbert Scott, Kt., by one sometime his pupil" (Alfred Bell, who died in October 1895).

St. James Less, Westminster: Series in apse exhibiting careful system of iconography (1861); apostles, &c., in aisles; three-light window in south clerestory, the Resurrection.

St. John Baptist, Croydon: Great east window (1870); noble series in north aisle of nave (1880-90).

St. John Baptist, Kensington: Two lancets in north tran-

* These windows are interesting as being among the earliest works of Mr. J. R. Clayton, just after he set up in partnership with the late Mr. Alfred Bell in Cardington Street, Hampstead Road. Some mention of them is made in page 217 of Sir Gilbert Scott's *Personal and Professional Recollections*.

† A sumptuously fitted church built at the sole cost of Mrs. Gooch.

‡ The north-western window, commemorative of one who was a great musician, is interesting as being the very last work of the kind reviewed in *The Ecclesiologist*, which came to a conclusion with the number for December 1868.

§ Finished in 1862 from the designs of Benj. Ferrey. The chancel was refitted a few years later, when the east window and frescoes were added under Street's superintendence.

sept (St. Joseph and St. George); two pair lancets north aisle (St. Martin and St. Basil, St. Ambrose and St. Athanasius, 1898); all treated in a fifteenth-century style. The late James Brooks was the architect of this stately cruciform stone church.

St. John Divine, Kennington: Apse and south chapel for G. E. Street, R.A. (1874). One of the most remarkable churches built during the Revival in the transpontine districts of the Metropolis.

St. John Evangelist, Red Lion Square: Two tiers of five lancets at east end; two windows of two lights in south chapel (1878-88), and lancets in apse. In this church, remarkable for combination of graceful detail and skill in dealing with an irregular site, the late J. L. Pearson, R.A., has given us another specimen of that peculiar type of Early English which was first demonstrated in St. Augustine's, Kilburn. His idea for connecting a wide nave with a much narrower chancel, as evidenced in this church, was doubtless derived from the cathedral of Gerona. An exterior view of St. John's will be given next week.

ST. JAMES LESS, WESTMINSTER.
(G. E. Street, R.A., Architect, 1861.)

King's College Chapel, Strand: Series forming part of Sir Gilbert Scott's remodelling (1863-73).

Lambeth Palace Chapel: Series of lancets inserted during Mr. J. P. Seddon's restoration under Archbishop Tait.

St. Laurence, Gresham Street: Two at east end placed during the late Sir A. Blomfield's refitting in 1868, and remarkably beautiful.

St. Margaret, Lee, S.E.: Quintuplet of lancets at east end, representing the "Te Deum," with brilliantly tintured figures on white grounds; a truly superb piece of work, inserted during the late James Brooks's recasting of the interior (1876).

St. Mary Aldermary, City: Complete series of Third Pointed windows in aisles and east window; the west window—the Radix Jesse—is a grand piece of vitreous decoration.

St. Mary Abbots, Kensington: The entire series. The finest are at the east and west ends and in the clerestory of the nave, where are small single effigies in brilliant tinctures on white grounds. This church is a good example of Scott's style subsequent to his return to more strictly English detail. Church consecrated in 1872; tower and spire completed 1879.

St. Mary, Stoke Newington: Lancets in clerestory of transepts. The figure of St. John in the northern arm is one of Clayton & Bell's earliest works (1858), central window of apse (1861), others in apse (1876-86), spherical windows in clerestory of chancel.*

St. Mary Magdalene, Munster Square: Alderson memorial windows in south aisle; one representing the Resurrection, designed by Butterfield (1859-60); Charrington memorial window, west end of either aisle (1880-90); east window of Stuart memorial aisle (1884).

St. Mary Virgin, Primrose Hill: Three in apse good, but subjects somewhat too microscopic.

St. Matthias, Stoke Newington: Windows in Monk Memorial chapel (1884-94); two small but excellent recent specimens of these artists' work.

St. Michael, Cornhill: Complete series inserted (1859-60) when Sir Gilbert Scott "recast" this church. The series on south side taken *en masse* is of great richness, and the "Majesty" within a large circle over the altar has a remarkably impressive effect viewed from the west end.

St. Michael, Croydon: The tall, narrow lancets of the apse, and those in the square-ended south chapel, for the late J. L. Pearson, R.A., one of whose finest works this church is.

St. Pancras: The three square-headed windows in the apse, inserted 1866, are good specimens of Clayton & Bell's work at the time; the superb series in and below the galleries are fifteen years later.

SS. Peter and Paul, Teddington: East window, for G. E. Street, R.A., 1867, one of the most beautiful works executed by Clayton & Bell in conjunction with that architect; richly-coloured groups on white quarries; absence of accessories and canopywork.

St. Peter, Eaton Square: Romanesque triplet at east end, inserted in 1873 when the chancel, the first part of Sir A. Blomfield's scheme for reconstructing this church's interior, was completed. There are other fine specimens of Clayton & Bell's work in this church.

St. Saviour, Paddington: East window of chancel, reconstructed in 1888.

St. Saviour, Pimlico: East window.

St. Saviour, Clapham (Cedars Road): West, east and transept windows, forming a connected series from the Life of Our Lord (1864-66); somewhat archaic in treatment, like most of Clayton & Bell's works at that period, but abounding in rich colour properly balanced by white. The church, an early Middle Pointed structure, from the design of J. K. Knowles, is cruciform, with a lofty pinnacled tower at the intersection grouping well with the chancel and transepts.

Savoy, Chapel of St. John in the: Several on either side, easily distinguishable by their style from those of other artists.

St. Sepulchre, Holborn: West window of tower (1884).

St. Stephen, Hampstead: A square-headed window in the south aisle in memory of the architect of this sumptuous and in many respects picturesque church, S. S. Teulon, who died in 1873. Subject, "Solomon building the Temple."

St. Stephen, Lewisham: Complete series for Sir Gilbert Scott. The eastern and western triplets admirably exemplify Clayton & Bell's mosaic or medallion style of 1865-70. The small figures of English saints on white grounds in the lancets of the clerestory are typical examples of how such windows should be treated.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. W. H. Seth-Smith, president, in the chair. Messrs. E. G. Dawson, D. N. Paddon and A. Pomeroy were elected members. The meeting also elected Mr. R. H. Weymouth to act on the general committee.

The President, in speaking of the premises fund, said he wished there were more donations of a guinea. Such subscriptions would show that the appeal was supported by the Association's own members. The scheme for new premises was not a matter of ambition; it was an urgent necessity. The Association must be prepared to go into new premises at the end of two years or else renew the old lease of their present

offices. The committee were hopeful of their appeal by the sums already received, but for success the Association would have to rely upon the support of its own members.

The following list of donations was announced, in addition to those already published:—The Architectural Association 1,000*l.*, Mr. Basil Champneys 50*l.*, Mr. H. T. Hare 50*l.*, Mr. E. W. Mountford 50*l.*, Messrs. Ernest George & Yeates 50*l.*, Mr. John Belcher 25*l.*, Mr. Beresford Pite 20*l.*, Mr. E. Guy Dawber 12*l.* 12*s.*, Mr. R. S. Balfour 10*l.* 10*s.*, Mr. Francis Hooper 10*l.*, Mr. H. D. Searles-Wood 10*l.*, Mr. E. M. Gibbs 10*l.*, Mr. A. Paull 6*l.* 6*s.*, Mr. W. A. Forsyth 5*l.* 5*s.*, Mr. A. H. Hart 5*l.* 5*s.*, Mr. H. P. G. Maule 5*l.* 5*s.*, Mr. J. H. Squire 3*l.* 3*s.*, Mr. C. B. Bone 3*l.* 3*s.*, Mr. F. D. Clapham 2*l.* 2*s.*, Mr. W. H. Raffles 2*l.* 2*s.*, Mr. E. F. Reynolds 1*l.* 1*s.*, Mr. H. Teather 1*l.* 1*s.*, Mr. P. J. Turner 1*l.* 1*s.*, Mr. A. O. Collard 1*l.* 1*s.*, Mr. Stanley Towse 1*l.*

Mr. ARNOLD MITCHELL, in the absence of Mr. Francis Bond, who was indisposed, gave a lantern lecture, dealing mainly with

Details in Church Architecture.

He said that he was asked to contribute a paper on capitals, but he claimed a wider license for his remarks, and he would speak of details in old work of which capitals formed a part. Much of the interest of old buildings was due to their details, and if carefully examined they would find that the details in English ecclesiastical architecture seemed to surpass any foreign examples. The general grouping of all the parts, and the harmony of the exterior to the surroundings gave additional effect to many English churches, and the lecturer said there was no more beautiful picture than the cloister of Salisbury Cathedral. In interior work the triforium seemed the part of the design which received the first thought of improvement by the Mediæval builders. In tracing the progress of the embellishment of the triforium, they would find that none of the compositions were the result of sudden ideas, but rather the gradual development of what had gone before. The treatment of Norman arches was crude, simple and elementary, but the builders were confined to rough stones and workmanship. Architectural effect by the arrangement of stones was soon appreciated, and this was followed by improvement in mouldings. The effect of recessing was wonderful, and the contrast in varying light and shade gave architectural severity. Incised ornament introduced in the tympanum was another advancement; but although in these improvements they secured richer effects the actual designs were simple. Rochester and Peterborough Cathedrals were good examples. Lincoln Cathedral, too, was notable, inasmuch as it was a complete epitome of all our architectural styles. Ely had elaborate mouldings gradually working to the geometric tracery. In their sculpture the Mediævalists were also careful in their work, and it was interesting to-day to trace out the subjects. The builders were content with the telling of their story, and either distorted the figures or the facial expression of the characters introduced. Their sculptured work showed a fertility of design, though they seemed content to copy natural forms rather than those based upon the ideal. No trouble was too great to get effect, and the marble capitals in Lincoln gave testimony to the labour, skill and care with which they worked out their inspirations. The scalloped enrichment in their early capitals seemed to have been an accident, and yet the elaboration of the scalloped work resulted in the greatest advancement. The introduction of concave instead of the convex forms was another improvement. In all their work the builders of the Middle Ages were in earnest, and their designs resulted in the maximum architectural effect with the minimum expenditure.

The PRESIDENT said the student never tired of going over the details in early architecture. They had had in the views exhibited lessons which could not fail to be of the greatest interest and practical importance to their work. The suggestion that cost in building could be saved by the application of brains was of value to the architect if he could only impress its importance on the client. Architects would thereby bring credit on their profession. Another great lesson was the enormous importance of studying Gothic to attain freedom in style.

Mr. ALEXANDER WOOD proposed a vote of thanks for the lecture, which was seconded by Mr. C. H. BRODIE. Mr. H. P. G. MAULE supported the motion.

The Foundation-stone of a new church, to be erected at a cost of 4,500*l.*, at Pentonville was laid on Saturday. The church measures 38 feet by 45 feet, and seating accommodation will be provided for 250 persons. Below the church is a gymnasium with the same floor space and 15 feet high. The building is being constructed by Messrs Campbell, Smith & Sons in red brick with Bath stone dressings, from the designs of Mr. R. A. Briggs.

* A detailed account of this noble church will be found in *The Architect*, February 23, 1900.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A PRELIMINARY EXAMINATION, qualifying for Probationership R.I.B.A., was held simultaneously in London and the provincial centres indicated below on the 5th and 6th ult. One hundred and eighty-eight candidates were admitted, and 37 were exempted from sitting. The remaining 151 were examined, with the following results:—

	Passed.	Relegated.	Total Examined.
London	59	15	74
Birmingham	8	3	11
Bristol	7	3	10
Exeter	3	4	7
Leeds	20	6	26
Manchester	17	6	23
	114	37	151

The following are the names of the successful candidates, together with those exempted, making a total of 151 newly registered probationers:—

William Litchfield Allen (Regent's Park), Frank Leslie Atwell (Plumstead), Herbert Joseph Axten (Crouch End), Charles Henry Barlow (Widnes), John Jackson Beck (Doncaster), Alan Leslie Belcher (Brixton), William Thomas Benslyn (Birmingham), Horace Eugene Bernton-Benjamin Windsor), Albert Bolton (Bingley), Arthur Boulton (Dundee, I.B.), Thomas Brameld (Hull), James Edward Godfrey Burroughs (Bristol), Herbert Carnelley (Yorks), William Carver (City Road), Ernest Stewart Charlton (Tunbridge Wells), Harold Griffith Cherry (St Albans), Clement Chippindale (Harrogate), Harold Hutton Christie (West Kensington), Wilfred Thorp Clarke (Birmingham), William Thomas Clarke (Liverpool), Robert Hawkin Cochrane (Rathgar, Dublin), John Cocker Timperley), Gilbert Scott Cockrill (Gorleston), Henry Richard Collins (Exeter), Arnold Sutherland Constable (Stockfield-on-Tyne), William Henry Howard Cooke (Stroud, Glos.), Archibald Cooper (Rickmansworth), Frank Conrad Rutteau Dabbs (Clapton Common, N.), George Francis Blackburne Daniell, B.A.Cantab (London), James Sylvan Butchart Davidson (Aberdeen), Arthur Henry Davis (Notting Hill), Francis Moorhouse Dean (Streatham), David William Ditchburn (Leytonstone), Alex. Houston Douglas (Maida Vale), Andrew Douglass (Morpeth), Gordon Burdett Dransfield, Barnsley, Yorks), William Tees Duncan (Rochdale), Alex. Dunn (Moseley, Birmingham), Eric Edmonds (Stamford Grammar school), Alfred Hewlett Edwards (Leicester), Arthur Cecil Morris Edwards (Rickmansworth), Ernest Sugden Englund (Blackpool), Harry Launcelot Etherington-Smith, B.A. (Putney), Edward Willoughby Cole Faulkner (Freshfield, near Liverpool), Walter Granville Fearn (Clacton-on-Sea), Haworth Fielding (Accrington, Lancs), Algernon Hugh Fitzroy (Cross Cliff Hill, Lincoln), Frank Burwell Foster (Leamington), Harold James Fox (Stamford Hill), Donald Saunders Gardner (Weston-super-Mare), John Howard Goodchild (Crouch End), Blakeley Rinder Gribbon (Leeds), Arthur Hutton Gully (Bedford), Reginald Wilson Gunson (Manchester), Bertram Granville Gwyther (Egham, Surrey), George Hanson (Bradford), Francis Hurst Healey (Bradford), James Hardwick Higgs (Leicester), Henry Houghton Hill (Liverpool), Joseph Reginald Hobson (New Eltham), John Nixon Horsfield, junr. (Kingston-upon-Thames), William Henry Luckvale (Tring), Alastair Hope Kirk (Pall Mall, W.), Frederick Richard Jolliffe (Penarth, Glam), Basil Wallace Jones (Bexhill), George Howard Jones (Cardiff), Leon de Barr Kelsey (Kensington), Arthur William Kenyon (Sheffield), Ashley Scarlett Killby (Highbury), Charles Ussher Kilner (Bayswater), Stanley James Lampshire (Devonport), Albert Arthur Langman (Wimbledon), Herbert Langman (Southport, Lancs), Harry Brooksbank Laycock (Manchester), Harry George May (Wellingborough), Thomas Linton (Leith), James Henry Lowry (Liverpool), Percy John Maffey (Southampton), Ernest Harry Norham Major (Mecklenburgh Square), Harold W Markwick (Devonport), Robert Hattrick Mason (Birkenhead), Frederick John Matthews (Clapton), Montagu George Maule (Huntingdon), Frank Charles Mears (Edinburgh), Evan Holford Mills (Shrewsbury), Henry Graham Hunt Mills (Southsea), Alfred Mawson Millwood (Surrey), Edward Milnes (Rochdale), Sydney Wilfrid Mobbs (Lowestoft), Eric Morley (Bradford, Yorks), Paul William Mulready (Brondesbury), Frederick Turney Negus (Woburn, Beds), William Horace Nevell (St. Albans, Herts), George Edward Hanson Newbold (Gainsborough), James Norquoy (Chorlton-cum-Hardy, Manchester), Dominick Mary O'Connor, B.A. and B.E. Dublin (Southall), Sidney Stuart Parkinson (Gravesend), Guy Pemerton (Edgbaston, Birmingham), Gilbert Eyre Peto (Bath), George Edward Phillips (Cambridge), Arthur Patrick Hector Pierce (Auckland, N.Z.), Albert Edwin Poley (Hampton Hill, Middlesex), William Dathy Quirke (Camden Road, N.W.), Norman Loal Read (Leicester), Arthur George Edward Rebbeck (Somerset), Harry Jones Roberts (Portmadoc), Robert

George Roberts (Doncaster), Archibald Hurley Robinson (Birmingham), Bernard Royce (Leicester), Walter Puckering Rylatt (Hull), Harry Shackleton (Keighley), William Henry Shute (Newport, Mon), Ernest Harry Smith (Leicester), John Woodfield Smith (South Hampstead), James Conran Smythe (Mutley, Plymouth), Robert George Stevens (Bromley, Kent), Joseph Daniel Stevenson (Redhill), Russell Stockton (Stockport), Ralph Stokoe (Sunderland), Hugh Spencer Stowell (Croydon), Percy Montagu Stratton (Salisbury), Laurence Walton Taylor (Newcastle-on-Tyne), Charles Edward Tebbs (Upper Tooting, S.W.), Frederick William Tempest (Notts), Eric Edward Temple (Upper Norwood), Claudà Beckett Romako Terrell (Tonbridge, Kent), Robin Audrey Thomas (Gosport), Morris Thompson (Doncaster), Gilbert Mackenzie Trench (East Dulwich), John Reginald Truelove (Sharrow, Sheffield), Richard Froude Tucker (Upper Teddington), Jabez Tennyson Turner (Essex), Horace George Turner (South Croydon), Michael James Wadsley (Hull), Percy Francis Warren (Norwich), Alexander James Watson (Newcastle-on-Tyne), Bryan Watson (North Shields), Reginald Francis Wheatly (Bromley, Kent), Howard Enstor White (Birmingham), Richard Wakeham White (Kentish Town), Alexander Hornby Whyte (Kensington), Tom Smeaton Wilcockson (Chesterfield), Leslie Wilkinson (Cyprus, New Southgate), Herbert Attenborough Willatt (Nottingham), Edward John Williams (Leicester), John Ross Wills (Derby), Richard Horace Willson (Kingston-on-Thames), John Driver Winder (Wandsworth Common), Alfred Thomas With (Anerley), William Oswald Wright (Morecambe, Lancs), John Arthur Yells (East Dulwich).

The intermediate examination, qualifying for Studentship R.I.B.A., was held simultaneously in London, Bristol, Leeds and Manchester, on the 5th, 6th, 7th and 8th ult., with the following result:—

	Number Examined.	Passed.	Relegated
London	52	29	23
Bristol	9	5	4
Leeds	7	3	4
Manchester	11	8	3
	79	45	34

The following are the names of the passed candidates given in order of merit as placed by the board of examiners:— Archibald Scott (Glasgow), Courtenay Melville Crickmer (Regent's Park), Herbert Wilson Asman (Bradford), Walter Frederick Clarke Holden (Cambridge), Charles Henry Brightiff (Southampton), Willie Josiah Freeman (Halifax), Archibald Gilpin (Bristol), Ernest Llewellyn Hampshire (Rye Hill Park), Vincent Corbet Cook (Wolverhampton), Douglas Anderson (Hampstead), Joseph Edward Mundell (Dorset), Charles Barry Cleveland (Cambridge), Bernard David Tracy (Camden Road), Joseph Henry Taylor (Battersea), John Wilcock (Bradford, Yorks), Charles Percy Moss (Crouch Hill), Harold Slater (Preston), Kenneth Duncan Stewart Robinson (Westminster), Charles Herbert Heaton (Wigan), Henry Ralph Crabb (Exeter), William Bunter Colthurst (Taunton), Augustus Robert Crisford (Eastbourne), Percy Aspden Horrocks (Bolton), Edward Miller Ellis (Fenchurch Street), Percy Ripley Strong (Balham), Frank Sykes (Manchester), Frederick George Brooker (Peckham Rye), William Thomas Curtis (West Dulwich), Sydney Herbert Raintorth (Lincoln), John Weston Jarvis (Moseley, Birmingham), Henry Walcott Stone (Taunton), John Tallents Wynyard Brooke (Cheshire), Reginald Wentworth Alfred James Cosway (H.M. Prison, Wandsworth), Edward Harding (Brixton Hill), Florence Fulton Hobson (Belfast), Edwin Riddell Kennedy (Belfast), Sydney Maddock (Cheshire), Leon Morris (New Brompton, Kent), Bailey Scott Murphy (Edinburgh), William Robert Osborne (Swindon, Wilts), Frank Ifor Moran Owen (Liverpool), Stanley Highfield Penlington (Sunderland), Edward Randolph Sladen (Bucks), John Barlow Smith (Bedford), Charles Joseph Thompson (Lincoln's Inn Fields).

The final and special examinations, qualifying for candidature as Associate R.I.B.A., were held in London alone from the 15th to the 22nd ult. Sixty-two candidates were examined and the following thirty-seven passed, the others being relegated to their studies:—

Charles Thomas Adshead (Stockport), Sidney Walter Bensted (Wandsworth Common), Ernest George Besant (Cambridge), Alfred Ernest Biggs (Brooklyn, Felixstowe), Austin Barugh Botterill (Streatham), Charles Alfred Broadhead (Nottingham), Harold Busbridge (Plumstead), Ralph Scott Cockrill (Great Yarmouth), Henry Louis Emile Merille de Colleville (Brighton), William John Devlin (Adelphi), Walter Ernest Dobson (Hampstead), Walter Watkin Ellison (Kent), James Ewing (Regent's Park), Edward Lawrence Gaunt (Ilkley, Yorks), Arthur Everett Gibbins (Islington), Francis Robert Boyd Haward (Marylebone), Ralph Eustace Hemingway (Nottingham), Augustus Edward Hughes (Regent Street), Allen Trevis Hussell (Ilfra-

combe), Ernest William Lees (Mecklenburgh Square, W.C.), Edward Berks Norris (Birmingham), Leonard Rycroft Oakes (West Kensington, W.), Harold Frederic Ponton (Hammer-smith Road), William Beddoe Rees (Cardiff), Charles Herbert Reilly (Victoria Street), Frank G. Richardson (Tufnell Park), Ernest George Rodway (Weston-super-Mare), George Lister Thornton Sharp (Barnes), William Slater (Nottingham), Francis Danby Smith (Victoria Street, S.W.), Thomas Marshall Smith (Tollington Park), Arthur Halcrow Verstage (Camden Square), Walter Stephen Tucker (Newmarket), Joseph Alfred Woore (Derby), Edmund Livingstone Whatten (Croydon).

The following shows the number of failures in each subject of the final:—

I. Design	23
II. Mouldings, &c.	18
III. Materials	11
IV. Sanitation	13
V. Specifications	1
VI. Construction: foundations, walls, &c.	11
VII. Construction: iron and steel, &c.	10

The Ashpitel Prize.—On the recommendation of the board of examiners the Council have decided to award this prize to Mr. Charles Thomas Adshead (probationer 1894, student 1897), he having most highly distinguished himself in the final examinations held during the current year.

Special Prize.—On the recommendation of the board of examiners the Council have decided to award a prize of books of the value of 10*l.* to Mr. F. Dare Clapham, in recognition of the merit displayed by him in his work at the special examination held last June. Mr. Clapham obtained the highest number of marks ever awarded at the final and special examinations.

ARCHÆOLOGICAL DISCOVERY IN CRETE.

IT will be remembered, writes a correspondent of the *Times*, that the revelation of a great palace on the site of Phaestus, in the south of Crete, by the Italian archaeologists Haltheu and Pernier last spring, almost rivalled in interest Mr. Evans's discoveries at Knossos. News now comes that, since the departure of the Italians for the autumn, peasants have lighted on a series of rock tombs in the neighbourhood of the palace, evidently belonging to some generation of its lords. These tombs, which are both of the dome and chamber types, contained several skeletons apiece, richly adorned with gold objects, such as necklaces and rings, in which are set engraved gems, representing cult-scenes, demons and other typical Mycenaean subjects. The discovery is of exceptional interest, since no tombs have hitherto been found pertaining to the great Cretan palaces, and it is only in tombs that the richer objects of the luxurious prehistoric civilisation of the island are likely to be found.

It seems that the Cretan Government, on hearing of the first find, sent its *ephor*, M. Xanthodides, to the spot, and this gentleman has continued the peasants' work. This action has caused great indignation in Rome, and has been followed by a protest from the Italian Minister for Foreign Affairs. For Phaestus and all its vicinity are definitely and exclusively conceded to the Italian Mission, and the latter has always intended to search for the cemeteries, and contemplates the resumption of the palace excavations in the coming winter. The Cretan Administration is still somewhat lacking in experience; but it ought to know that, beyond necessary police measures, it cannot, without grave breach of international courtesy, as understood in Europe and especially in Greece, under the rule of M. Kabbadias, conduct excavations on a spot already conceded and not yet resigned by the concessionaires. No doubt, however, it will explain the matter to the satisfaction of the Italians, and see that a similar lapse does not occur again.

Mr. George A. Macmillan, treasurer of the Cretan Exploration Fund, writes:—

The managers of the Cretan Exploration Fund are just issuing to the subscribers and to others interested in the matter a statement summing up the results of the excavations undertaken during the last two seasons on several important sites in the island of Crete, and notably at Knossos, where Mr. Arthur Evans has partly laid bare a magnificent prehistoric palace which it has not been thought unreasonable to associate with the name of King Minos.

For the artistic and archaeological results of these remarkable discoveries, I may refer your readers to the circular in question—which I trust, sir, may find hospitality in your columns—or to the fuller accounts which have been published by Mr. Evans and Mr. Hogarth in the *Annual* of the British School at Athens.

My object in addressing you is to call special attention to the financial aspect of the matter. The balance-sheet submitted by the directors of the fund shows that since it was established in the spring of 1900 about 3,500*l.* have been

raised by subscriptions, partly from learned societies, but mainly from individuals. Rather more than this sum is shown in the published accounts to have been spent on the excavations at Knossos, Kephale, the Dictaeon Cave, Kato Zakro and Praesos. Knossos alone is accountable for 2,000*l.* out of this sum, but unfortunately even this does not represent more than half the money spent on this important site. For, without reckoning his travelling or personal expenses, Mr. Evans has himself spent 2,000*l.* on the work in the last two seasons. To complete the excavation of the palace it is estimated that another 2,000*l.* will be required, and, considering the unique importance of the discoveries made, it ought not to be difficult, even in these times, to raise so moderate a sum. Two points I should wish to emphasise. First, it would not be creditable to us as a nation to leave an excavation, which has already yielded such valuable fruits, unfinished for lack of funds. Secondly, the explorer himself, who has already devoted so much time and labour to the work, ought not to be allowed to draw further on his private resources, at a sacrifice which, as his friends know, is more than merely personal. One could wish that enough money might be raised to recoup him at least in part for what he has already, in his disinterested zeal, spent out of his own pocket. But at least he should be spared the necessity of further sacrifices.

In conclusion, I wish to draw attention to the fact that Mr. Hogarth has secured the right to excavate another very important early site which he would be prepared to undertake next season if a sum of at least 600*l.* could be raised for the purpose. Unless this sum can be assured this very competent explorer must reluctantly abandon further work in Crete, which would involve a serious loss to archaeological research.

I have only to add that contributions to the Cretan Exploration Fund may be sent to the account of the fund at Messrs. Robarts, Lubbock & Co., Lombard Street, or else to me, at St. Martin's Street, W.C.

The statement to which Mr. Macmillan refers gives the history of Mr. Evans's excavations at Knossos, and describes their results. As to their general value it says:—

Apart from the architectural results already gained, the finds within the walls of the palace have been of such a nature as to throw an entirely new light on the art and culture of prehistoric Greece. Partly still clinging to the walls, partly on the floors of the chambers, were found the remains of a whole series of fresco-paintings. Among these the full-length figure of the cupbearer supplies the first real portrayal of a man of the Mycenaean age, while the miniature groups representing court ladies show a liveliness and expression far beyond any work of the kind in contemporary Egypt. Another more recently unearthed fresco represents a bull-catching scene in which female "cowboys" take part. Allied to this branch of art are the painted reliefs in *gesso duro*, showing a force and naturalism for which no parallel can be found till the great days of Greek sculpture some ten centuries later. To the remarkable bull's head discovered last year the more recent excavations have added parts of human figures, in which the muscles and even the veins are reproduced with a singular mastery of execution. With these was found a relief of the upper part of a male head bearing a kind of fleur-de-lis crown, copied from an original in precious metals. . . . Of all the discoveries made within the Palace of Knossos the most interesting is the accumulated evidence, here for the first time afforded, that there existed on the soil of prehistoric Hellas a highly developed system of writing some eight centuries earlier than the first written Greek monuments, and going back six or seven centuries even before the first dated record of the Phœnician script. A whole series of deposits of clay tablets has come to light, many of the most important of them during last season's excavations, engraved with a linear script, often accompanied by a decimal system of numeration. That these documents largely relate to the royal stores and arsenals is seen by the pictorial illustrations with which the inscriptions are often accompanied. Others, in which signs representing men and women frequently occur, probably contain lists of slaves or officials. Others again of a different class may, perhaps, ultimately reveal to us fragments of contemporary correspondence or the actual formulas of Minoan laws.

Beside these linear tablets there was discovered a separate deposit of clay bars and labels containing inscriptions of a more hieroglyphic class. Although contemporary with the linear tablets, the script on these is apparently of quite distinct evolution, and in all probability in a different language. The characters answer, in fact, to the sign-groups already observed in certain seal-stones mostly found in the east of Crete. The hieroglyphs themselves present many parallels to the presumed pictorial prototypes of Phœnician letters.

After references to the work done by the British School at Athens, which has also received assistance from the Cretan Exploration Fund, the statement concludes as follows:—

Other interesting sites, already previously secured for

ish 'excavation,' remain to be explored. The executive committee, however, are of opinion that, before devoting any money towards breaking new ground, a sufficient amount shall be raised to enable Mr. Evans to complete his excavation of the Palace of Knossos, a considerable part of the cost of which has already fallen on his shoulders. The large scale of the work, on which throughout the greater part of last season 200 men were constantly employed, makes it necessarily costly, and in this case, in addition to many other incidental expenses of expenditure, a great deal has to be done towards the preservation, and in some cases even the roofing-in of the chambers discovered. It is estimated that, apart from the heavy arrears on last season's work, a sum of between 1,000*l.* and 2,000*l.* will be necessary for the adequate completion of this important work alone. The unique character of the results already obtained is, however, so fully recognised that the committee confidently trusts that no financial obstacles will stand in the way of this consummation. In order to carry out the satisfactory exploration of other sites allotted to the fund, at least twice the above amount will be ultimately required. The directors have recently acquired the right to explore a certain early site of exceptional interest. From the point of view of primitive civilisation there is, perhaps, no site in the Aegean which promises such rich results. It is much to be hoped that at least 600*l.* may be available over and above what is necessary for the completion of the work at Knossos in order to explore this early settlement during the coming season, there being always risk of a serious loss to the fund in postponing the exploration of such sites when once the attention of natives has been drawn to them.

THE CELTIC GOLD ORNAMENTS.

THE Society of Antiquaries, at a special meeting held at Burlington House, passed the following resolution with regard to the proposed action of the Government in connection with the Celtic gold ornaments acquired in 1897 by the British Museum:—"That the Society of Antiquaries of London, which takes a keen interest in all matters connected with the archaeology of these islands, views with marked dissatisfaction the proposal to remove from the British Museum certain gold ornaments lately acquired from Ireland. The Society is of opinion that the cause of archaeology will be best served by the retention of those interesting objects in the central museum of the Empire, where they are accessible to a greater number of students than would be the case elsewhere; while, as remains of the art of the ancient Britons, and having only an accidental connection with Ireland, these relics could be placed nowhere more appropriately than in the British Museum. That this resolution be communicated to the Lords Commissioners of the Treasury, and be humbly laid before His Majesty the King, the great patron of the Society."

NEW VAUXHALL BRIDGE.

THE completion of the new Vauxhall Bridge is as yet an event of the dim and distant future, but if ever it does get finished, says the *Daily News*, it promises to be structurally very interesting. It will, if present intentions are adhered to, present what may be regarded as a new system of stone and concrete bridge building in this country.

The object of the new system—at present embodied only in model—is to give to stone or concrete bridges something of the elasticity which it has already been employed to give to steel structures, and by this means to permit of a great reduction in the necessary dead weight of the bridge and of the amount of material employed in its construction. If the new principle is finally adopted, each arch will consist of two distinct sections, divided from each other at the centre of the arch and from each abutment or pier. In other words, each arch will have a slit or division at either end, and another in the middle, instead of being one solid structure throughout. The bridge as a whole will be of concrete, but the ends coming together will be formed of solid blocks of granite. Across the width of the bridge there will be thirty-five of these granite blocks on each side of the slit. If these masses of granite were built into the bridge in the ordinary way, two rows of them would of course come together at the crown of the arch. But by this new system they are kept slightly apart by massive cast-steel pivots laid in sections between them. There is a steel groove let into the face of the granite on each side of the slit, and the steel pivot is laid in this groove, forming a sort of hinge between the two sections of the arch, paraffin wax being poured down into the groove to prevent corrosion.

If a very heavy load is brought over a bridge the arches of which are constructed in this way, instead of the fabric bearing up rigidly against the load, there is a slight flexibility. The crown of the arch is slightly depressed. The weight comes down upon the steel pivot in the middle of the slit and the

pressure tends to distribute itself evenly throughout the arch. At each of the shore ends of the bridge there is a similar steel pivot laid between granite blocks forming a similar hinge for giving play to flexibility, and thus tending to distribute the strain brought by a "line" load anywhere about the bridge. In consequence of this distribution it is possible, as has been said, to make the whole fabric lighter and with less material. Built on this principle, the new bridge need, it is calculated, be only about 3 feet 6 inches in depth at the centre, 3 feet 9 inches at the "springings"—where the bridge springs from the abutment, that is, while at the "haunches"—the point of greatest strain, about one-third of the distance from the abutment, the crown—the depth need be only 4 feet 3 inches. This mode of building is calculated to give a concrete bridge the strength and endurance of granite at about half the expense. Carried out in this way, it seems probable that the new Vauxhall Bridge would give an entirely new lead to stone and concrete bridge building in this country. It is a principle very well known in steel bridges, but hitherto it has been confined to them.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE annual general meeting of this Society was held in their library at the Museum, Queen Street, on the 30th ult., Mr. David Murray, LL.D., vice-president, in the chair. In the course of his report on the work of the Society during the past session, Dr. Christison, secretary, stated that the interesting results of the Society's excavations in the Roman sites of Birrens, Birrenswark, Ardoch, Camelon and Lyne has encouraged the Council to continue the investigation of Roman sites during the past year, with funds supplied by generous gifts from Sir Herbert Maxwell, the president, of 50*l.* for the excavation of the rectangular fort of Rispa in Galloway, and of 150*l.* by the Hon. John Abercromby for the excavation of the extensive earthworks at Inchtuthil, Perthshire, to which they were invited by the proprietor, Sir Alexander Muir Mackenzie of Delvine, Bart. The results of these extensive excavations had been very interesting, and would be laid before the Society during the present session. Another series of excavations by Professor T. H. Bryce, of St. Margaret's College, Glasgow, aided by a small grant from the Society, had also yielded important results, to be communicated at an early meeting. The Society was to be congratulated on the completion and publication of the catalogue of the Scottish coins in the National Museum by Mr. A. B. Richardson, curator of coins, and the important work on the early Christian monuments of Scotland, with full descriptions and illustrations, which had been long in preparation by Mr. J. Romilly Allen and Dr. Joseph Anderson, was drawing near its completion. The volume of the proceedings of the Society for the past year, which would be issued shortly, would contain the report on the excavation of Camelon, the heaviest and the most fruitful that the Society had yet undertaken, besides other reports of examinations of less important Roman sites. The course of Rhind Lectures delivered last month by Bishop Dowden, on the constitution, organisation and law of the Mediæval Church in Scotland, would be followed next year by a course on the secular architecture of Scotland by Mr. Thomas Ross, architect, who had previously given a course on the ecclesiastical architecture of Scotland; and the Council had further provided for the two following years by the appointment of Professor Hume Brown, LL.D., to deliver a course in 1903 on the times of Mary Queen of Scots, and of Mr. George Macdonald, M.A., to deliver a course in 1904 on the origin and history of coinage. The Gunning Fellowship had been again given to Mr. F. R. Coles to continue his survey of the stone circles of Scotland, and his report to be communicated to the Society in the present session would deal with about seventy sites surveyed during this his third survey. The report of the museum showed that the additions during the year had been 764 by donation and 668 by purchase, while 139 books had been added to the library by donation and 42 by purchase.

TESSERÆ.

Academies of Art.

ON the question of the influence of academies upon art especially Voltaire asserted that the French school became mannerists and mere imitators, after the establishment of the French Academy, and Hogarth energetically opposed the proposition to establish one in this country. He declared that the institution would serve to "raise and pension a few bustling and busy men, whose whole employment will be to tell a few simple students when a leg is too long or an arm too short. More will flock to the study of art than what genius sends; the hope of profit or the thirst of distinction will induce parents to push their offspring into the lecture-room, and many will appear and but few will be worthy. Paintings are plentiful enough in

England to keep us from the study of nature, but students who confine their studies to the works of the dead need never hope to live themselves; they will learn little more than the names of painters. True painting can only be learnt in one school, and that is kept by nature." How far these expressions of Hogarth have been justified is a question too extensive for discussion here. The results of establishing the Royal Academy are that a school of English art does really exist, that it has obtained an honourable position amongst the European academies of art, that its characteristics in portraiture, in landscape and domestic subjects are truth to nature and comparative absence of mannerism, and that the style usually taught in academies and designated "academic" is exactly that which the English school has scarcely attempted; but were any public encouragement offered to artists no doubt can exist that our school could pour forth "its mobs of heathen divinities, nymphs with castellated crowns to represent cities, and the virtues ready ticketed and labelled," as readily as any school of artists, French, German or Italian.

Creation of the Beautiful.

There are two senses in which a thing may be beautiful—the one in which by virtue of some particular association it will excite the emotion of beauty in the mind of a particular spectator, and the other in which it possesses some quality which will naturally make it appear beautiful to all men in all ages. An object which conveys the sense of beauty to any particular person is beautiful to him, and all tastes are therefore equally just, so far as the individual himself is concerned. But it does not therefore follow that all tastes are equally desirable; and if we aspire to be creators of beauty for the admiration of others, we must take care that the elements we employ are such as are the common and natural signs of agreeable emotion. In the exercise of this function we must subdue all our personal associations and address ourselves to the interesting impressions of ordinary minds, and that taste will in this case deserve to be called vitiated which satisfies the associations of only a particular caste of individual, or erects the creations of an eccentric fancy into an idol for universal adoration.

Magnitude in Architecture.

In architecture magnitude is the principal cause of grandeur, although shape and colour may also greatly conduce to this end. Nevertheless, forms either natural or artificial which possess a shape unfavourable to their grandeur may from their excessive magnitude alone become objects of considerable grandeur, as is the case with many mountains and also with several large buildings. Solidity, which corresponds with strength or power in objects of action, and the solemn dignity which appertains to all edifices of magnitude, contribute much to their grandeur. The Norman and Roman styles are well adapted for obtaining grandeur from the boldness and simplicity of character which distinguish them. Association of ideas has a powerful effect in the promotion of grandeur, and of beauty also, but probably more in some arts than in others. Age and decay thus give a character to many edifices that no auxiliaries of art can supply, and which they do in a great measure by the associations that they excite.

GENERAL.

Mr. Walter Emden, past-president of the Society of Architects, has been unanimously awarded the gold medal of the Society in recognition of his services during the past four years.

Mr. C. L. N. Wilson, water engineer and town surveyor, died at Chinde, South Africa, on his way to take up an appointment in the military service. He was a zealous volunteer officer.

Messrs. Brown & Watt, of Aberdeen, have prepared plans for the new poor house which is to be erected at Oldmill, near that city, which have been approved by the Local Government Board for Scotland.

A conversation with **Mr. William Woodward**, architect, on the subject of trades unionism and building workmen is narrated in this week's *Commerce*.

The **Second Ordinary Meeting** of the Society of Architects fixed for December 12 has been unavoidably postponed till Thursday, December 19.

"**Rue Charles Garnier**" is likely to be the name of the new street in Paris which will lead from the Rue Laffitte to the Rue Lafayette. It is in the vicinity of the opera house designed by the architect.

Lieutenant-Colonel Shipway, the purchaser of Hogarth House, Chiswick, has announced his intention that it should remain unaltered as one of the landmarks of the parish.

Mr. Fred Wild, architect, of Bradford, lately died in the town. He was for many years manager and assistant for Mr. W. J. Morley, and since he started separately he erected several new buildings in Bradford.

The **Hôtel Pavla**, a famous modern residence in the Champs-Élysées, is proposed as a mairie for the Eighth Arrondissement. The Grand Salon, which was adorned with work by Baudry, Delaunay, Boulanger, Dalou, Delaplanche and other painters and sculptors, will serve as a *salle des mariages*.

The **Exhibition of Scottish Art** at the Whitechapel Art Gallery will be opened by Mr. A. Birrell, K.C., on Thursday next. In the evening Sir Martin Conway will deliver a lecture.

Dr. Purdie, Professor of Chemistry in St. Andrews University, has offered the university a gift of 5,000*l.* for the purpose of building and equipping a small chemical research department at St. Andrews. Professor Purdie says that their universities are very poorly provided for research when compared with those of foreign countries, and that scientific industries suffer in consequence.

The **Death** is announced of Mr. E. E. Oliver, who was connected as engineer with the Indian Public Works Department since 1868 and latterly had charge of the works in the Central Province. Among his literary compositions were essays on "The Decline of the Samanis and Rise of the Ghaznavis," "The Chagatai Mughals," "The Safavis in Persia," "Coins of Akhbar in Karegra," "Coins of the Mahomedan Kings of Gujrat," "Across the Border, or Pathan and Baluch."

The **Italian Chamber** have adopted Bills approving the purchase by the Government of the Villa Borghese Museum and expropriation of the villa itself.

Mr. E. A. Abbey, R.A., in his picture of the Coronation will show the interior of Westminster Abbey. It will be at least 15 feet in length.

A sum of nearly 2,000*l.* has been received for a memorial to the late Dean Ingram, of Peterborough. After the cost of the memorial tablet has been defrayed, the balance will be devoted to the restoration of the west front of the cathedral. A further sum of nearly 2,000*l.* is required to complete the renovation of the fabric, so that the work begun in 1883, upon which nearly 50,000*l.* has been spent, may be completed.

The **German Government** have voted 300*l.* towards the expenses of an international congress on the question of the housing of the poor, which is to be held next year at Düsseldorf.

An **Appeal** is being made by the committee of the Epping Forest Free Local Museum for 250*l.* which is still required to complete the suite of cases and fittings and to purchase sets of specimens and models, &c., to supplement the collections contributed by members of the club and others.

The **Civil Service Commissioners** announce that an open competitive examination for an appointment as draughtsman in the Hydrographical Department of the Admiralty will be held shortly. Copies of the regulations and forms of application for admission to the examination may be obtained on application, by letter, to the Secretary, Civil Service Commission, Westminster, S.W.

Mr. Peter Bibby, architect, Flint, has been appointed on the commission of the peace for the county of Flint. Mr. Bibby was already a member of the borough bench of magistrates.

Saturday was the last day for receiving plans, &c., in connection with private Bills for the ensuing session of Parliament. This year the total deposits number 318, consisting of 48 railways, 24 tramways, 72 miscellaneous and 174 provisional orders, including electric lighting. This total compares unfavourably with that of last year, when it was 362, made up of 46 railways, 24 tramways, 93 miscellaneous and 199 provisional orders. The miscellaneous schemes include Dover Harbour, Liverpool Cathedral, Post Office (Acquisition of Sites), Dartford Improvement, Medway and Thames Canal, City of London (Spitalfields Market), Royal College of Science and Public Offices Site, L.C.C. (Tramways and Improvement), West Ham Improvement, and London and India Docks Company (Various Powers).

The **Northern Architectural Association** will hold a meeting on Wednesday next, December 11, at 36 Northumberland Street, Newcastle-upon-Tyne, when Mr. J. Miller Carr (of Messrs. Doulton & Co., Ltd., London) will lecture on "Terracotta: Constructional Faience and Ceramic Mural Decoration." The subject will be illustrated by coloured drawings, cartoons, enlarged photographs of completed buildings, and large specimens of actual work.

Mr. S. Inskip Ladds, A.R.I.B.A., architect, of 7 Doughty Street, Mecklenburgh Square, W.C., informs us that he has opened a branch office in the Market Place, Huntingdon.

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

AUSTRALIA.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

BURSLER.—Dec. 20.—Competitive plans are invited for an isolation hospital. Premiums of 100l. and 50l. will be awarded to the designs placed first and second respectively. Mr. Arthur Ellis, town clerk, Burslem.

GLASGOW.—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100l., 50l. and 25l. respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

HULL.—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs

placed first, second and third in order of merit (100l., 60l. and 40l.). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

KENT.—Jan. 1.—Competitive designs are invited for laying-out about 16 acres of land, near Canterbury Road, Gillingham, as a recreation-ground. Premiums are offered of £20, £10 and £5. Mr. F. C. Boucher, clerk, Gardiner Street, New Brompton, Kent.

LEIGH (LANCS).—Competitive plans are invited for an infirmary or cottage hospital. Premiums of £30, £20 and £10 will be awarded for the first, second and third best plans. Mr. J. H. Box, hon. secretary, Infirmary Committee, Williams, Deacon's Bank, Leigh, Lancs.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

SCOTLAND.—Jan. 15.—The Kirkcaldy Burgh School Board invite competitive plans for a technical and science and art school to accommodate from 400 to 500 pupils, and an elementary school to accommodate about 400 pupils. Mr. Alexander Beveridge, clerk to the Board.

CONTRACTS OPEN.

WINCHESTER.—For erection of two pairs of cottages on the Shawford Southdown estate. Messrs. Colson, Farrow & Nisbett, architects, 45 Jewry Street, Winchester.

At Walsall Guildhall on Tuesday Colonel W. R. Slacke held an inquiry on behalf of the Local Government Board into an application by the Town Council for sanction to a loan of 1,800*l.* for surface drainage works. The town clerk (Mr. J. R. Cooper) explained that it had been found that the sewers in the borough were not large enough to carry off the water which ran into them whenever there was a storm, and this had led to flooding in some of the lower parts of the town, which had occasioned great inconvenience. There were also difficulties in the way of dealing with it at the sewage-farm. A scheme for laying a complete system of surface water throughout the borough had been prepared by the borough surveyor, the town being divided into fifteen districts. The estimated cost of the whole scheme was upwards of 23,000*l.*, but the Council thinking that expenditure too large to incur at one time decided to carry out the work in instalments. It had already been done in two districts at a cost of 262*l.* in excess of the estimate. In the third district the cost had originally been put down at 2,716*l.*, but the rise in the price of materials and labour had rendered it necessary to increase the estimate by 30 per cent. In addition, owing to the growth of the town, it had been found necessary to put in a further length of sewer and an increased size of pipe. The lowest tender for the work was 4,360*l.*, and this added to the cost already incurred made a total of 7,338*l.* A loan of 5,500*l.* had been previously sanctioned, and this application was to make up the balance in excess of estimate. The borough surveyor (Mr. R. H. Middleton) having given details of the work to be carried out, the inquiry terminated.

FIRE TESTS WITH DOORS.

THE British Fire Prevention Committee again undertook a series of investigations at their Bayswater Testing Station on Wednesday afternoon. Mr. Edwin O. Sachs, chairman of the Executive, presided, and among the principal visitors were Sir Joseph Renals, Bart. (lately Lord Mayor), Sir James Weeks Szlumper (lately Mayor of Richmond), Major Fox (London Salvage Corps), Captain Dyson (Windsor), and a number of representatives from the London County Council, the local authorities and principal fire insurance companies.

The afternoon was devoted to tests with doors, firstly with two double deal doors and two double oak doors; secondly, with a single "Jarrah" wood door and a single "Karri" wood door, the thickness of the doors in each case being 2 inches.

The double oak doors appeared to have very considerable fire-resistance compared to the deal double doors, the test in each case extending to 1½ hours.

The "Karri" and "Jarrah" wood doors were unfortunately badly constructed by the makers, and although the wood itself showed considerable resistance during a test of one hour, the fire appeared to get through where the joints had not been satisfactorily made.

The full official reports will shortly appear in the usual way. It may be noted that the testing operations were somewhat hampered by the fog, all the photographs and records having to be taken by flash-light.

Prior to the tests Mr. Sachs entertained a party of officials and visitors at luncheon in the principal committee-room.

BUILDERS who are willing to tender for the erection of a mansion on the sea front at Hove are invited to send their names to the architects, Messrs. Clayton & Black, 152 North Street, Brighton. Bills of quantities will not be supplied.

THE PLUMBERS' COMPANY DINNER.

THE Lord Mayor and Sheriffs dined on Tuesday night with the Worshipful Company of Plumbers at the Haberdashers' Hall, Gresham Street. The two branches of the Legislature were represented by Lord Glenesk, Mr. J. Powell Williams, M.P., the Hon. Claude Hay, M.P., and Mr. H. E. Duke, M.P., and the Government Departments by Sir S. Provis (Secretary of the Local Government Board), Sir Geo. Kekewich (Board of Education) and Sir H. Craik (Scotch Education Department). Among the other invited guests were a number of metropolitan and provincial mayors. The Master (Mr. Charles Hudson) presided, and there were also present Alderman Sir John Knill (the Warden) and Alderman R. Hind (Renter Warden).

The Plumbers' is one of those City Guilds which stands in the same position in the reign of King Edward VII. as in 1365, when Edward III. was on the Throne—that of a practical educational institution—and in responding to the toast of "The Houses of Parliament," Lord Glenesk expressed a hope that the Bill promoted by the Company for the compulsory registration of plumbers would soon be passed by Parliament.

Mr. H. E. Duke, replying for the Lower House, spoke of the Company's Bill as just one of those utilitarian measures that was awaiting the attention of the House of Commons.

The duty of proposing the toast of the evening—"Prosperity to the Plumbers' Company and its Public Work"—fell to the Lord Mayor. The Plumbers', unlike many other City Companies, had not, he said, lost its claims to be a trade guild, and he too, as a member of Parliament, hoped the time was not far distant when the Company would have power to certificate those who entered upon the career of a plumber. The toast was acknowledged by the Chairman.

In giving "Our Guest," the Warden, remarking that there were a thousand gates to death, expressed the view that none

were open so wide as that which admitted obnoxious gases to our homes.

At the conclusion of the speeches a conversazione was held.

ABERDEEN ASSOCIATION OF CIVIL ENGINEERS.

THE first ordinary meeting of the Aberdeen Association of Civil Engineers was held recently in Robert Gordon's College, Aberdeen. After Mr. P. M. Barnett, C.E., engineer-in-chief of the Great North of Scotland Railway, had delivered the inaugural address, a paper was read by Mr. James Barron, C.E., on "Harbour Construction," in the course of which he said that on the east coast there were few natural sites for harbours of refuge, and consequently they could only be obtained by the construction of costly breakwaters. He exhibited a design of a national harbour of refuge in Wick Bay, which had been submitted to the Commissioners appointed in 1883 to select a site for a harbour of refuge for the east coast of Scotland, to be constructed by convict labour. It was outside the scope of his paper to introduce controversial matter regarding the best site for a national harbour of refuge for the east coast of Scotland, but he might be allowed to state that the natural features of Wick Bay lend themselves for such a purpose to a greater extent than any other point on our coast. However, the site was not selected, but as it had been recommended by the highest nautical and engineering authorities for the past sixty years, it might be safely stated that none of the other designs or sites submitted to the Commissioners offered the same advantages as Wick.

TRADE NOTES.

THE contract for the new laundry machinery at the East Grinstead Workhouse has been placed with the Cherry Tree Machine Company, Ltd., of Cherry Tree, near Birmingham.

Harlow, and 34 Old Broad Street, E.C. His "Champion" coil boiler has also been selected for heating All Saints Church, Cambridge, by the low-pressure system.

THE War Office has erected a handsome building to provide additional accommodation for the recreation establishment at the Tigne Barracks, Malta, in the tower of which is to be placed a striking turret clock, with four dials and gravity escapement, manufactured and supplied by Messrs Kendal & Dent, of London.

ELECTRIC NOTES.

MR. W. M. ROGERSON, chief assistant in the Nottingham Corporation Electricity Department, has been appointed electrical engineer to the Halifax Corporation in succession to Mr. Street, who has obtained a better appointment in Southampton. The salary attached to the post is 400*l.* per annum.

MR. H. P. POULNOIS, M.Inst.C.E., of the Local Government Board, held an inquiry at Morecambe on Tuesday into the application of the Urban District Council to borrow 5,000*l.* for electric lighting purposes, 1,035*l.* excess expenditure on the refuse destructor, and 200*l.* excess expenditure on street improvements.

A REPORT has been prepared by the Edinburgh electric lighting committee of the Town Council which shows that during the six months just ended the loss on the operations of the undertaking in Edinburgh has been reduced by about 3,400*l.* compared with the corresponding six months of last year, when the figures were over 9,000*l.* This year the sum is about 6,000*l.*

BUILDING AND BUILDERS.

THE foundation-stone has been laid of the new chapel which the Primitive Methodist community are erecting at Woodhouse Hill, Hunslet.

IT has been decided to build a Primitive Methodist school-chapel at Shaw, Oldham, at a cost of between 1,500*l.* and 1,600*l.* A Nottingham architect has submitted plans to the local District Council, which have been approved.

THE building committee of St. John's District, Heywood, Lancs, have accepted plans prepared by Mr. Oakley, of

Manchester, for the erection of a new church in the parish in place of the present iron structure. It is proposed to build the chancel, organ-chamber and vestries, and use the present iron structure as the nave.

CONSIDERABLE difficulty is being experienced by the Woolwich Borough Council in procuring a site on which to erect municipal buildings for the accommodation of their staff. It is proposed to pull down a large number of cottages (which can ill be spared) in the rear of Woolwich Police Court and Town Hall, on a portion of the Ogleby estate. It is estimated that the site alone will cost several thousand pounds.

A SITE has been selected for the proposed Stoke Newington swimming baths north of the passage in Albion Road, and powers are being sought to acquire nine houses and land for the purpose. The site abuts on to the Council's offices and yard in Milton Road, adjoining which it is proposed to erect a dust-destructor, the heat thus generated being used for raising the temperature of the water.

SINCE the appointment recently of a resident priest to the church of St. Mary at Bo'ness the present chapel has been found to be quite inadequate and unsuitable for the wants of the congregation. Realising this, it has been resolved to proceed at once with the erection of a school which will also serve as a place of worship. The site of the proposed new school is situated on the Stewart Avenue.

THE master builders in the West Bromwich and surrounding Black Country districts gave an intimation to their operatives some time ago that, owing to the depressed condition of the trade, they found it necessary to ask for relief in the shape of a reduction in wages, and it was suggested that the men should concede a reduction of $\frac{1}{2}$ *d.* per hour. It is reported that the operatives have determined to refuse this, but some of the leading employers, upon being asked, asserted that they have not as yet had any official intimation of the decision of the men. It is not likely that any further action will be taken on either side before March or April next.

A TERRIBLE accident befell some steeplejacks while at work at Marsden on Sunday afternoon, one man being killed on the spot, whilst another died from his injuries in Huddersfield infirmary at seven o'clock in the evening. A well-known steeplejack named John Tinker, of Manchester Road, Huddersfield, who has had a long experience in the work of chimney building, was engaged to extend a chimney standing 35 yards high at the premises of Messrs Crowther, Bruce & Co.,

woollen manufacturers. The necessary scaffolding, &c., had been satisfactorily erected, and the work of removing the upper portion of the chimney prior to the extension was being proceeded with, when a considerable portion of the coping-stone and bricks fell. Four men were on the scaffold, these being Bernard McHugh (about 30), of Castlegate; Richard Code (31), Cross Grove Street; James Tinker (20), son of Mr. Tinker; and Vincent McDermott (25), Castlegate, all of Huddersfield. Falling material caused the wooden stage to jerk severely, with the result that McHugh and Code were precipitated to the ground. The former was shockingly injured, and died almost immediately. Code was conveyed unconscious to the infirmary suffering from fracture of the skull and both legs, and died about an hour after admission. The two others had a miraculous escape, and it is stated that they saved their lives by clutching at the fixed material on the chimney, though neither was able to give an intelligible account of his experience. McHugh was engaged to be married at Christmas.

VARIETIES.

THE Bishop of Exeter has opened the new parish hall of St. Simon's at Plymouth. It will seat about 500, and until the new church is built will be used for services. Mr. Ambrose Andrews, of Plymouth, is the builder, the architect being Mr. Harbottle Reed, of Exeter.

AT the last meeting of the Liverpool estate committee a letter was read from Councillor Brownbill suggesting a central railway station to connect the various Liverpool railways. The committee agreed to invite Mr. Brownbill to attend its next meeting.

THE Manchester Society of Architects will hold its third sessional papers meeting in the board-room of the Chamber of Commerce, No. 44 Mosley Street, on Thursday next, December 12, after the special general meeting, when Mr. Halsey Ricardo will read his paper, entitled "The Revival of Gothic Architecture," illustrated by lantern slides.

THE new United Free church at Newtyle, which has been erected at a cost, exclusive of bell and organ, of 1,600*l.*, was formally opened on Saturday last. The new church occupies an admirable site in the centre of the village, granted by Lord Wharnclyffe, and takes the place of an inadequate little building which has served the congregation since the disruption.

AN interesting ceremony took place at the Kidderminster Roman Catholic church on the 27th ult. to mark the completion of the spire which now surmounts the tower, and which has been built at a cost of about 1,000*l.* Another addition has at the same time been made to the church by the gift of a peal of five bells.

AT St. Mary's Hall, Coventry, recently, Colonel C. H. Luard, R.E., held an inquiry into the application of the Coventry Corporation for sanction to the borrowing of 1,945*l.* 7*s.* 4*d.* and 610*l.* for the respective purposes of providing police-station, library and reading-room, and fire-station for Foleshill. There was no opposition, and the inspector afterwards visited the site of the proposed erections.

AN extension of the hospital at Dover, by the addition of a new out-patients' department, is to be carried out as a memorial to the late Queen Victoria, and the foundation-stone was laid by Lady Pearson on Wednesday. An operating theatre is also being built as the town's memorial to the late Sir Richard Dickeson, who was for many years president of the hospital. The foundation-stone of this section was laid by the Countess of Guilford. The Earl of Guilford was also present.

A MIXTURE of powdered Canadian asbestos with 10 per cent. of white lime has been recommended in Germany as a mortar having important advantages, with slow drying as the only disadvantage. It resists fire to an extraordinary degree and is also waterproof, exposure to a hot fire for an hour and a half followed by a drenching with water having had no effect. The mortar is very tough, and only half as heavy as cement mortar.

AMONG the contents of *The House* for December, which are specially suitable for Yuletide, may be mentioned "Santa Claus"—which introduces a pleasing variation in the old-fashioned Christmas tree—an illustrated article on Christmas decorations, and also "A Christmas Play, and how to produce it." Besides these seasonable articles, there are also full instructions for a new Home Art Work in Plaster, with working drawings; an illustrated article on Buckingham Palace and details of an important prize competition in designing for Home Art Work, with prizes to the value of over 10*l.*

FOR some time past it has been rumoured that the Islington parish, or borough church is unsafe, and it now appears there is good reason for this belief. The building has been examined by an architect, and it is proposed, in place of

EMIT NO SMELL. GIVE NO SMOKE.

NO DIRT OR TROUBLE.

NO DANGER.

Mr. D'OYLY CARTER, of the Savoy Theatre, writing of these Stoves, says:—"I used your Hygienic Gas Heating Stoves in this Theatre all last winter, and found them in every way most satisfactory. I think I must have had ten or a dozen of them in various parts of the Theatre, and in the very cold weather we had last winter they succeeded in warming the corridors, &c., admirably. Two of them were used to heat the Business Offices of the Theatre, and they fulfilled this object capitally while apparently in no way injuring the air in the offices—a most important consideration."

Illustrations and full particulars to be obtained of all Ironmongers and Gas Engineers, and of the Patentees and Sole Makers—

making extensive alterations, to rebuild the entire structure. The present edifice, which is better known as St. Mary's Upper Street, was opened for Divine service on May 26, 1754. It is expected that an attempt will be made to demolish the edifice next spring, and during the process of building the services will be held in the Bishop Memorial Hall attached to the vicarage.

THE new fever hospital which has been erected at Tippetthill, near Bathgate, has been formally opened. The building and furnishing have cost over 8,500*l*. The new hospital occupies a conspicuous position, and has a handsome outward appearance, while inside it is fitted up in the most modern fashion. It gives accommodation for twenty-eight beds, two pavilions containing twelve beds each, and the two observation wards, which are attached to the administrative block, accommodating two beds each. The cost per bed works out at 316*l*. Messrs. John Melvin & Sons, Alloa, are the architects.

A COMMODIOUS new post office, which is in course of erection in Castle Foregate, Shrewsbury, where it is greatly needed, is now approaching completion, and it is hoped that it will be ready in time for the Christmas rush of business. It is built of brick, with some stone facing, is heated by hot-water pipes and paved with wood blocks. On one side are the offices of the superintendent of the department, from which that official can ascend unobserved to a "crow's nest," and notice what is going on in all parts of the sorting-room. Quite adjacent are a large dining-room, a kitchen, storeroom, pantry and other offices, and at the rear of the premises are a large yard and offices, which will be used by the outdoor telegraph department. The mails will be loaded and unloaded in a covered passage running alongside the sorting-room.

THE Birmingham Medical Officer of Health's quarterly report includes a section dealing with the sanitary work performed by the Health Department, in which Dr. Hill points out that as many as 712 houses were cleansed, 559 were repaired and twelve were closed as unfit for habitation. Thirty houses were provided with better ventilation, water was removed from the cellars of 100 and the spouting of 150 was repaired. The danger to health arising from the presence of ashpit and pan privies was reduced by the conversion of 195 of the former and 107 of the latter into water-closets. Considerable attention was given during the quarter to the proper provision of receptacles for ashes and house refuse, 256 tubs or

pails being ordered and provided. To improve the condition of the courts, sixty-four yards were paved and 120 were repaired. The Corporation staff also cleansed a number of courts at the expense of the landlords or tenants.

A MEETING of the Edinburgh Architectural Association was held in their rooms, No. 117 George Street, on the 28th ult., Mr. Henry F. Kerr, president, in the chair. Mr. Louis A. Barnier, B.A., delivered a lecture on "The Old Monuments of Provence." The lecture opened with some remarks on the history of the country, and showed how the influence of Greek and Roman civilisation began earlier and finished later than in the rest of Gaul, and therefore left a stronger mark on the people, who have ever since preserved an individuality and have been, so to speak, a nation apart from the rest of the French. Some of the monuments, Roman theatres, amphitheatres, temples, mausoleums, &c., in the following towns were specially mentioned:—Orange, Avignon, Tarascon and Beaucaire, Arles, Aignes, Mortis, Carcassone and Nîmes. These buildings were also illustrated with a set of very fine limelight views. At the conclusion of the lecture Mr. Hunter Crawford proposed a hearty vote of thanks to Mr. Barnier for his lecture, which was duly accorded.

SHALLOW UNDERGROUND RAILWAYS.

A REPORT has been prepared by Mr Alfred Baker (tramways manager), Mr. John H. Rider (electrical engineer), and Mr. J. Allen Baker (vice-chairman of the highways committee of the London County Council) on the underground lines which have been adopted in New York and Boston. "In the latter the methods adopted for building the subway were of three distinct types. In the first the side walls and the arch are of masonry, a single wide arch covering the whole subway. In the second there are two distinct tunnels side by side, each built of masonry. In the third upright steel columns for the side walls and transverse steel girders for the roof are used, with masonry and concrete around and between them. . . . The open inclines leading to the surface roads have granite walls, and are protected by railings. . . . The standard height of the roof is 14 feet clear above the surface of the rails, and the roof is generally about 3 feet below the street surface. In some places, however, the subway is considerably lower than this. . . . One of the most important differences between a shallow sub-

way and a deep-level tube, from the point of view of the travelling public, is well illustrated at Boston. Instead of having to descend a very great number of steps or enter a lift in order to reach the cars, passengers use a short, well-lighted stairway, having from twenty-five to thirty steps. . . . The stairways are covered by neat kiosks, or similar structures, placed at convenient points, either on the sidewalks or, where there is sufficient width, in the centre of the roadway. Persons can thus descend to the platforms or ascend to the street in a very few seconds. In our opinion this single feature is in itself one of the principal factors in the great popularity of the subway.

"We were particularly struck with the brightness and airiness of the subway. The air was extremely good and fresh, and gave us the impression of being constantly changed. There was no stuffiness, and although the day was hot the temperature inside the subway was pleasantly cool. At the same time, the difference in the temperature was not so great as to be likely to cause chill or discomfort by the sudden change. The subway was well lighted by incandescent lamps, besides which a considerable amount of natural light was obtained. . . . We were also impressed by the comparative quietness of the subway, both as regards the street traffic and the noise which might have been expected from vehicles passing overhead. . . . The number of cars running in each direction is about 250 per hour, or about 4,000 in each direction per day of sixteen hours. On the Central London Railway there are only 350 trains per day in each direction. These, of course, are trains consisting of about five carriages, but even allowing for this the traffic in the Boston subway is considerably greater than in the 'Twopenny Tube.'

"In New York instead of the arched roof and the massive masonry sidewalls of an ordinary underground railway, the plans of the Rapid Transit Commission call for a structure rectangular in shape, and built in an open trench. On a concrete bottom will be erected, at intervals of 5 feet, running across the line of street, frames of steel beams, securely rivetted together. Between these frames, or ribs, will be built a concrete wall and a concrete roof of sufficient thickness to enclose the steel structures entirely. In addition to the side walls thus formed, the roof will be supported by rows of light steel columns between the tracks. . . . Part of the subway will have four tracks. The two centre tracks will be used for an express service, with stations $1\frac{1}{2}$ miles apart, and it is expected that a speed of about thirty miles an hour will be obtained. On the outer tracks the stations will be at much more frequent

intervals, averaging four to the mile, and the trains will run at a speed of about fourteen miles per hour. This will necessitate two types of stations, one with platforms on the outside of the outer tracks, at which the local trains only will stop, the express trains running through the centre tracks, and the other with outer platforms for the local trains only, and island platforms for either express or local trains. At these latter stations the subway is depressed sufficiently to allow of a bridge under the roadway over the four tracks, with stairways leading to the various platforms. . . . The contract price for the construction of the New York subway was 35,000,000 dols. (7,000,000l.)."

Mr. Allen Baker, in his addendum to the report, says:—"There are distinct advantages in favour of the shallow tramway as compared with the deep tube, especially when the construction and operation is undertaken by the municipal authority." The advantages are said to be as follows:—

1. The shallow construction may be used as a subway for water, gas, electric, &c., mains, as well as a tramway, thus affording a double advantage and yielding a double revenue.

2. When the pipe services have been removed into their subways the great annoyance and disadvantage now experienced by the tearing up of the streets by the companies would be over, as no work would require to be done on such streets except repaving or repairing of the pavement.

3. This double service would not only enable the municipal authorities to deal with the pipes and mains without loss to the ratepayers (which would be impossible otherwise), but should prove to be financially profitable.

4. The shallow tramway should be less costly for construction than the deep tube, and as it would run so near the surface, and be provided with more frequent stations, is not only better ventilated and better lighted, but, being more accessible to the public, would receive greater patronage, especially by short-distance riders.

5. The shallow tramway following the routes of the streets would avoid running under any private property, thus preventing the possibility of objection being raised on account of vibration (and which would also be entirely prevented by its special construction).

6. The service would be much more frequent than in the deep tube, thus avoiding any waiting for trains, and as the shallow tramway would be approached by steps from the street (which would be 12 or 14 feet above the tramway platforms) the time taken to descend by the elevators to the deep tube

would be saved, and also the expense of operating the elevators, which is an important item of working cost.

7. As these underground tramways have proved to be a great financial success and a public benefit in reducing congested street traffic in such cities as Boston, Paris and Budapesth, it may be safely assumed that a like result would be experienced in London, where the population and the need are so much greater.

8. The provision of these subways in connection with the Council's surface lines would greatly enhance the value and increase the earning power of the Council's tramway system in London, and the providing of a complete system of intercommunication would be of the greatest value in solving the housing problem.

Powers are to be sought to construct a shallow tramway in connection with the new Holborn to Strand thoroughfare.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, December 2, Mr. Charles Mason, president, in the chair, a paper was read on "The Sewage Question during the last Century," by Mr. H. Alfred Roechling, C.E., F.G.S.

After some preliminary remarks relating to his subject, the author gave a short history of the theory and practice of sewage purification during last century. Concerning its theory he remarked that from the position of pure instinct it had advanced through various stages, until at last Pasteur and others had given it that form it now generally took, viz. that in sewage purification, mechanical, chemical and biological agencies played an important part, and that the decomposition of the organic matter was in the main a bio-chemical process.

Dealing with the practice of sewage purification, the author observed that the only known method of sewage treatment at the dawn of the last century was irrigation on land. He then pointed out how, years afterwards, chemistry had tried to make a lucrative business out of it; how commission after commission, and in fact every authoritative inquiry, had expressed an unmistakable verdict in favour of land treatment, and how, in consequence of this mass of accumulated evidence, the Local Government Board had been compelled to insist on and treatment of the raw sewage or effluent in any scheme of sewage disposal for which its sanction had been asked.

But the author observed that even the best of land could not do its work for ever, if it was not well looked after. And so it happened that through gross neglect and ignorance, the apparent failures created a strong feeling against land treatment, and finally led to the appointment of a new Royal Commission. This new commission had just issued its interim report, in which it had re-established land in its position as the first and only natural method of sewage treatment, and had termed all the biological or bacterial methods "artificial," some of which would be admissible without land.

The author next referred to the natural self-purification of sewage, or to the self-purification of sewage in the only natural medium, land, and considered in detail the self-purifying powers of land, mentioning among other things that besides its retentive and absorbing properties it possessed also the power to decolourise, to deodorise and to retain and render harmless such poisons as strychnine, nicotine, &c. The self-purifying process, he said, might be likened to a process of digestion, and when the digestive powers of land had been overtaxed sickness was the only natural result.

After describing the work of bacteria in the soil and some products of their activity, the author stated that experience and experiment had proved that the chances of pathogenic germs doing further harm on sewage farms were exceedingly remote. No soil, with the exception of peat—owing to its great amount of moisture—was probably entirely useless, and a loamy sand subsoil had in many instances proved very effective. The depth of soil necessary for purification depended on local conditions, such as the character and thickness of the top soil (humus), the nature of cultivation of same, the character of the subsoil, especially its facilities for retaining and exchanging air quickly, the surface slopes of the land, and the level of the subsoil water (thickness of the zone of evaporation and of the passage and capillary zones).

Dealing next with the artificial self-purification of sewage or the self-purification of sewage in artificial media, the author remarked that, apart from the sludge difficulty (which had been reduced but not altogether removed), these artificial methods had given very fair and encouraging results concerning the chemical purity of the effluent. But whilst warning his hearers not to expect that these theoretical results would be reached in practical working, and incidentally mentioning two cases of failure of works of this kind, he drew attention to the bacterial impurity of the effluent, which was little better in this respect than raw sewage. The legislature, however, could not con-

template without the gravest concern the wholesale admission of pathogenic germs into the streams, as an action might lie against a sanitary authority for causing an outbreak of typhoid fever lower down the stream.

After stating that the excessive quantities of manurial elements in the effluents from artificial self-purification works might engender such a luxuriant vegetation in the streams as to obstruct the natural flow of water and to completely cover the whole bed, the author stated that the objections raised led, in the natural order of things, to the supplementing of the artificial methods by the only natural one—land—when all reasonable requirements would be satisfied. It might likewise prove advantageous to partially treat the sewage by an artificial method before using it on the land. No system, however, would prove successful unless the present method of supervision of sewage-disposal plant was radically altered and the education of future managers systematically taken in hand.

HOUSING IN COUNTRY AND TOWN.

A CONFERENCE on "Housing in Country and Town," under the auspices of the Land Law Reform Association, was held on Tuesday at the Westminster Palace Hotel. Sir W. Foster, M.P., presided.

The Chairman said they hoped to stimulate public interest in the question and to bring about changes in the law. Taking some thirty registration districts throughout the agricultural portions of England, he found that since 1891 there had been a decline of 9.3 per cent. in the rural population, or, in other words, out of some 400,000 people no less than 38,000 had disappeared. The question would naturally be asked how it was, in view of these facts, that the housing accommodation was still insufficient. The explanation of the paradox was simple. The houses in the rural districts of England, owing to the depression in agriculture, to the fact that private enterprise did not find an outlet in the erection of such labourers' cottages as were required, and to other causes, were rotting away faster than the people were running away. The Housing Act of 1890, and the Amendment Act of 1900 had been in operation, but neither had so far had any great influence. The Act of 1890 was inefficient and unworkable. In a few instances, owing to the devotion of good people, the Act had been put in force, but their success had been hardly great enough to stimulate the

parish councils to undertake the Herculean labour involved. He believed they must not only have the power to acquire land at a cheap rate, but that they must put the responsibility on the local authorities of housing the people in a proper sanitary condition, and that the money required for the purpose should be obtained at the lowest possible rates. If we took a bold course future generations would be repaid a hundredfold.

Mr. R. J. Price, M.P., read a paper on "Housing in the Rural Districts," in the course of which he said that the vast majority of rural districts required only a very moderate capital expenditure to render their cottage accommodation sufficient and healthy. They asked that the Local Government Board should be the only controlling authority, and that on its being satisfied of the necessity for the cottages and the reasonableness of the building scheme, it should sanction the carrying out of the work by the rural district council and the advance of the required funds. The localities were willing to do their part if the Government would help them—first, by simplifying and cheapening the procedure of inquiry; secondly, by lending the money at the rate which it cost the Government; and thirdly, by extending the number of annual redemption instalments to 60 or even 75.

Mr. Channing, M.P., moved the following resolution:—"That this conference is of opinion that the scarcity and insanitary condition of the housing accommodation for the working classes in very many of the rural districts of England and Wales is a growing scandal and a menace to the well-being of the country; that as private enterprise has largely failed to meet the needs of the case, and as the Housing Act of 1900 has failed to give any impetus to municipal cottage building in rural parishes, a further Act should at once be passed enabling rural district councils (a) more easily to acquire land for the purposes of building and, if necessary, to use the compulsory powers granted to parish councils by the allotment clauses of the Local Government Act, 1894, except that the inquiry shall be conducted by the Local Government Board instead of by the county council, and that this shall be the only inquiry necessary, and except that the period for which the land may be compulsorily leased shall not be limited; (b) to build cottages, without the sanction of any other authority being required; (c) to raise a loan for these purposes, with the consent only of the Local Government Board, the period of repayment of such loans, if for the purpose of acquiring land, to be extended to 100 years, and if for the purpose of building, to be extended for 75 years; (d) to attach

gardens to the cottages, the limit of size of which shall be 1 acre instead of $\frac{1}{2}$ acre; (e) to delegate to a joint committee of the parish and rural district councils the building and management of the cottages. This conference is also of opinion that, if neither the rural district council nor the county council exercise these powers, the Local Government Board shall, on the application of the parish council, hold a local inquiry, and if satisfied that the working classes of the village or parish are not properly housed, and that the local authorities have neglected their duty in the matter, shall make an order on the rural district council to build such number of cottages with such accommodation as in the opinion of the Local Government Board is desirable."

Sir J. Dickson-Poynder, M.P., read a paper on the housing question in urban districts. The difference between the commercial value and the housing value of certain sites was immense; for instance, in the Holborn and Strand improvements the cost of setting apart certain land in the neighbourhood for rehousing amounted to 215% per head of the persons to be accommodated. On the other hand, sites were still to be obtained on the outer fringes of the county of London, where land could be bought at a sufficiently moderate price to allow for working-class dwellings being erected without having to exercise the artificial manipulation of writing down values. The simplest way would be to fix a fair sum per head as the basis of payment, and in the event of any difference of opinion arising the final assessment might be left in the hands of the Secretary of State or some board of arbitration appointed by him. It was obviously wrong that the fact of an owner possessing property of such an insanitary character as to be unfit for human habitation should afford him the opportunity of obtaining compensation for that property at the full improved value of the land. If Parliament by an improvement in the Housing Act were to say that in all future cases of insanitary areas the compensation allowed the owner should be limited to the actual value of the houses and the value of the land for rehousing purposes, it would reduce the expense of these schemes by a large amount, and, beyond that, it would have a far-reaching effect on all dwelling-house property throughout London.

Mr. T. Lough, M.P., moved the following resolution:—"That this conference, with a view to removing the grave and admitted evils in connection with housing in urban centres, urges—(1) That every facility should be given to local authorities to obtain land and build houses, and particularly (a) that no compensation should be paid to the owners of house

property which is condemned as insanitary and which has to be cleared at the public expense; (b) that money borrowed for the purpose of buying land should be repayable by instalments spread over a period of 100 years, and money borrowed for building should be repayable in a period of not less than 75 years; (c) that the procedure for acquiring land compulsorily for building should be greatly simplified and cheapened in matters of detail. (2) That all practicable means should be taken by Parliament and local authorities to improve the means of communication between the centres of the towns and the suburbs. (3) That in order to bring more building land into the market, in order to prevent the benefit of public improvements falling to a few private individuals, and in order to secure that all sections of the community shall contribute to the expenses of the community, a large measure for the rating of land values in towns is urgently necessary."

The resolution was carried unanimously, and the proceedings closed with a vote of thanks to the chairman.

THE BLACKLEY HOUSING SCHEME.

THE inception of the Manchester Corporation housing schemes, to which public attention has again been drawn by the suggested alteration in the plans of the houses on the Blackley estate, may be traced back as far as 1881. In that year, says the *Manchester Guardian*, Dr. Leigh, the then medical officer of health, presented a report which aroused much interest and created an imperative demand for remedies. The Council some time later appointed a special committee, afterwards called the unhealthy dwellings committee, with instructions to go into the whole matter. The result was seen in two schemes—one the Manchester Labourers' Dwellings Scheme, 1890, and another the Manchester Dwellings Reconstruction Scheme, 1891. By these schemes provision for persons displaced by the pulling down of insanitary premises was met by the erection of Corporation dwellings in Oldham Road, Pollard Street, Chester Street, Pott Street and Harrison Street. But provision had not been made at the end of 1899 to meet the large demand occasioned by the proceedings under the local Act of 1867. Upwards of 5,965 houses had been closed under that section, and only 2,782 had been substituted, although something like 300,000% had been spent on the various schemes for the better housing of the people.

THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE.

"PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of

TERTIGHT GLAZING without PUTTY.

NO OUTSIDE PAINTING REQUIRED.

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

When, therefore, an opportunity came for the purchase of an estate in Higher Blackley and within the city boundary, which a branch railway already proposed by the Lancashire and Yorkshire Company and the approaching adoption of electric tramways promised to render more accessible, the sanitary committee recommended this site as a means whereby a considerable number of people could be accommodated with suitable—not to say model—dwellings. The estate was a large one, covering about 237 acres, and it was offered to the Corporation for 36,000*l.*, or about 150*l.* an acre, including all the mineral rights. The recommendation of the committee was adopted by the Council. The Local Government inquiry into the application for borrowing powers was held in April of last year, and on that occasion Mr. Alderman M'Dougall, deputy chairman of the sanitary committee, in supporting the application, said the difficulty of the committee in dealing with insanitary dwellings would be much lessened if it were certain that houses would be provided in some degree approaching the number of houses closed or demolished. The fact that the Corporation were providing suitable houses for tenants of the working class in a healthy part of the city accessible to and from the centre by tramways and a railway would expedite and make more practicable the removal of insanitary properties. Of this land at Blackley it was intended to set apart about 50 acres for allotments, and the rest would be available for houses. The application was granted, and since that time the committee have been busily engaged with plans and schemes for making the best of their purchase. The estate will in process of time be reached from the one side by a proposed tram line, which is to begin at the top of Cheetham Hill Road, skirt Heaton Park, and probably proceed to Middleton through the village of Rhodes. On the other side a projected tram route is to join the Corporation system at Barnes Green, or rather at Blackley itself, now that the system has been extended thus far, and proceed north-west in an almost straight line to Middleton by way of Rochdale Road. At Middleton, of course, it joins on to the other line. The route by Middleton Road will pass the Blackley estate at Rhodes, and that by Blackley will skirt the other side of it for some distance. Then there are the projected Manchester and Middleton railway, with a station at Blackley, and the approach by Boothroyden Road, near Rhodes.

With regard to the laying out of the estate, two separate sets of plans have been prepared, but the full details of neither

scheme have as yet been made public. It is understood that the latest proposal, which has not as yet, however, been finally adopted, is to follow the plan of a similar scheme for the erection of model cottages at Leek, in Staffordshire. In that scheme, which finds considerable favour with the Manchester authorities, the houses are built in blocks of about ten dwellings. The exterior is of red brick, and presents a pleasant appearance. Each house has a garden behind and before about 15 feet wide, over which in the front elevation bay windows abut. The ground floor has excellent accommodation. A yard about 11 feet square contains a covered recess for coals, with outside offices. The kitchen, which overlooks the yard, is 14 feet long and 12 feet across in its widest and 9 feet 6 inches in its narrowest part. There is, too, a parlour or sitting-room, about 14 feet by 13 feet, except where the lobby for a short distance occupies 3 feet of space. The houses have a good scullery and pantry, with bath and provision for hot and cold water. The sleeping arrangements are, for cottages, commodious. There are three bedrooms, two of them about 10 feet by 14 feet and 9 feet to the ceiling. By an ingenious bit of planning the middle bedroom ceiling is raised to a height of 11 feet 6 inches, to make up for its smaller dimensions, which are slightly restricted by the stairhead. Behind the blocks there is a road for carts, 6 yards wide, whilst in front the plans show an avenue in which trees might be planted, and which is 20 yards wide. It is estimated that between 300 and 400 houses will be erected from the set of plans the committee may finally decide to adopt. Another feature of the scheme—already mentioned—is the setting apart of some 50 acres for allotments and gardens. These, of course, will prove a great boon if, as suggested, they are let at reasonable rents.

THE HOUSING OF THE WORKING CLASSES.

THE President of the Local Government Board received at Westminster a large deputation from the Association of Municipal Corporations, including representatives of Plymouth, Birmingham, Wolverhampton, Longton, Liverpool, Blackpool, Dewsbury, Leicester, Hull, &c., with regard to a series of suggested reforms in matters affecting local government.

The Mayor of Plymouth advocated an extension of the period for the repayment of loans under the Housing of the Working Classes Acts from forty to sixty years upon buildings,

and to 100 years for land, pointing out from the experience of his own town that under the present conditions it was impossible, without burdening the general body of ratepayers, to build cheap dwellings and let them at rents within the reach of the poorer of the working class.

The chairman of the Liverpool housing committee supported this view, pointing out that his city was considerably handicapped by the present limitation of the period prescribed for the repayment of loans for the provision of cheap working-class dwellings.

The town clerk of Wolverhampton advocated a consolidation of the Public Health Acts. He said it was more than a quarter of a century since the principal Act was passed, and since then many amending Acts had been passed; indeed, there were about forty Acts which had to be considered in the administration of sanitary work, with the result that there was a variety of conflicting decisions. He urged the amendment of the existing law in several particulars, and also that there should be an amendment of procedure in private bill legislation so as to lessen the cost and inconvenience. One desirable reform in this matter was the extension of the provisional order system and adoptive Acts.

The town clerk of Birmingham urged that the time had come for some Ministerial legislation on that question, especially as to valuation. The question had been agitated for nearly fifty years, and with the exception of an undoubted improvement in London, the country had experienced no advantage yet from a long series of commissions, committees and Bills on the subject of local taxation.

The Mayor of Hull spoke in favour of several amendments in the Lands Clauses Act, and the town clerk of Dewsbury spoke in support of a right of appeal to the Local Government Board in the event of county councils refusing to declare a road a main road.

Mr. Long, in reply, said he was in sympathy with everything that had been said in support of the consolidation of the Public Health Acts, and he hoped soon to ask the House of Commons to pass a measure with that view. He had prepared a Bill for the amendment of these Acts, dealing with many of the questions they had raised, and accepting many of the suggestions they had made. He was in favour of the compulsory registration of the ownership of slum property. The whole question of local taxation must obviously come up for consideration, and, he hoped, settlement, and in his judgment it must be preceded by a measure dealing with the question of

valuation. He had a Bill in preparation to deal with that subject. The question of trust investments was outside his jurisdiction, resting with the Treasury and the Lord Chancellor. Next, with regard to the housing of the working classes, he thought there was not sufficient positive evidence yet to show that if the period for repayment of loans was extended, that the alterations thereby effected in the rentals would be such as to bring the houses within the reach of the very poor; nevertheless, he had every desire to shorten the time and to lessen the cost of initial proceedings in connection with the housing question. He and the officials of his department would welcome any practical means of giving greater freedom to the action of local authorities. The officials of the Local Government Board were animated by no narrow or restrictive or prohibitive spirit, but they had certain duties which they must discharge. He would see whether it was possible to relax some of the conditions hitherto imposed upon municipalities. He held most strongly that the time had come when the local authorities should, as far as possible, be trusted to carry out their own work upon their own responsibility. He was entirely opposed to any undue interference with them by the central authority. Parliament should not call upon local authorities to do great work and then place them in leading strings, or deny them the right to think and act for themselves. If there was any extension of the period for the repayment of loans, he doubted whether it would be possible to confine it to the housing question, but he thought it was impossible to leave this subject exactly where it now was. He was carefully examining it from a departmental point of view. If he did not feel justified in dealing with the subject on his own initiative he would ask for the appointment of a Parliamentary committee to take such evidence as might be necessary. The conclusions of such a committee would, he hoped, afford reliable guidance to this and other public departments, which were concerned with the borrowing operations of local authorities.

ELECTRICITY AND RAILWAYS.

THE first meeting of the present session of the Institution of Electrical Engineers took place in the theatre of the Institution of Civil Engineers on the 21st ult., when Mr. William Langdon, electrical engineer to the Midland Railway Company, delivered his inaugural address as president. In the course of his

address Mr. Langdon said that, much as the world had benefited by steam, he believed that greater benefits would be derived from electricity. No one could remain insensible to the fact that our present mode of locomotion was destined in the near future to undergo great modifications. Our railways were becoming congested and the streets of our main towns were year by year becoming more blocked with traffic. Looking at the streets of Glasgow, which one might say were made for the electric tramcar, but in which congestion was still rife at times, he doubted whether electric tramways would deliver us from the latter difficulty. Their field in the larger towns was doubtless local traffic only, and the traffic between the city and more distant residential districts would have to be supplemented by a more direct, rapid and extensive means of transit. Short suburban lines of railway, radiating from one or more centres and supplemented by local tramways, would, it appeared to him, prove the solution of the impending changes associated with city-life locomotion. He next discussed the question whether electric traction would prove of service to our railway systems. Could it be at once adopted many improvements in the mode of dealing with the traffic would appear feasible. For example, trains—smaller in size, but travelling faster—might be despatched at more frequent intervals. He was convinced that great advantages would follow if it were possible to lessen the enormous difference that now characterised the speed of passenger and goods trains. Wherever the traffic was of a mixed character, and involved the movement of trains at speeds varying, say, from 20 to 60 miles an hour, time must be sacrificed, even when the scheduled times were observed; and this loss must be increased by the shunting of the heavy trains for the passing of those of a preferential character. But if by shortening these slow and heavy trains they could be run at a speed of not less than 40 miles an hour, there would be no shunting, except for the express trains, and, as all the trains would be moving at about the same speed, the capacity of the line would be practically doubled. Such a result would avoid that duplication of lines which was now unavoidable, and which was adding so many millions year by year to capital account. The operation by electrical means of the passenger traffic as it was conducted to-day would appear to offer no difficulty, but to reap the full advantages of an electrical service the entire traffic of the railway, both goods and passengers, must be worked by the same means. The only satisfactory way to prove the power of electricity to meet existing conditions was

to impose upon it the work to be done. To do so on a suitable section of line would not be a great tax on the resources of any one of our great railway companies, especially as it need not in any way, for the time being, derange the steam-worked traffic passing over that section. If electric propulsion should be found inapplicable to main-line traffic as a whole—a conclusion which few would accept even at the present time—it would unquestionably lead to the establishment of high-speed electric traction on independent lines between the chief commercial centres. Whatever success might attend such competitive electrical enterprises must be to some extent prejudicial to established systems, but the railway engineer would not be deterred from constructing railways by any consideration of the injury his work might inflict on existing interests. The only way to prevent him was to make it clear that there was no profitable need for any such addition. Railways had thus to face the fact that electricity as a motive power was before them, and that if it was not applied to existing systems it would come independently and in competition with existing interests. Mr. Langdon went on to mention some of the ways in which electricity was already employed in British railway service, giving in a tabular appendix a number of details of what the leading companies are doing in this respect. Finally he remarked that electricity was only treading on the edge of the vast domain it was destined to serve. It was only now, with the establishment of power-schemes destined to serve large areas, that we were approaching the economical conditions which would confer upon the commonwealth its fullest advantages. Electrical development in England had not been so satisfactory as it should have been. Over-legislation—that great desire to protect the subject, often at the cost of what he had to look to as his means of support—had no doubt retarded it, and with it the production of electrical machinery. The cry was for education, but of what avail was education without experience? It was experience that had gained for American engineers and manufacturers the position they had attained. But experience could only be obtained by actual work, and that had been, by those to whom power was assigned to put it in operation, delayed till the last moment, when much of it had perforce to be entrusted to those who were prepared to provide promptly the necessary parts. Thus work had been delayed, experience had been sacrificed, and much that should have enriched British industry had passed into other channels. What was needed was greater liberty, greater freedom and less restraint, for if electrical science was serving the community with

The POLICYHOLDER'S COMPANY

A POLICYHOLDER'S TESTIMONY.

In acknowledging the receipt of a Cheque for £3,883 6s. 5d. in settlement of Endowment Policy No. 453396 for £3,000 showing a bonus of nearly 3 per cent. per annum for 10 years, the Policyholder writes:—

"Had I taken a fully paid-up Policy instead of the above amount in cash it would have been £257 in excess of the figures given me when I took out the Policy 10 years ago. I have given expression to my satisfaction by taking out a fresh Policy in your Company for £10,000 on the Endowment plan."

advantage, was it desirable that statute limitations should interfere to preclude or prejudice its progress? Nothing could be easier than to restrain its use, if it were found injurious or undesirable, but to do so in anticipation was to deprive the country of its value.

The proceedings terminated with a vote of thanks to the President, proposed by Sir William Preece and seconded by Mr. R. K. Gray.

BUILDING REGULATIONS.

THE tribunal of appeal, consisting of Messrs. A. A. Yates (chairman), J. Grimput and A. H. Hudson have sat to consider an appeal against the decision of the County Council in reference to buildings at Brixton. The appellant was Mr. A. G. H. Brown, the trustee of the estate of Mr. J. J. Brown, who was represented by Mr. McIntyre. Mr. T. P. Andrews (of the Solicitors' Office) appeared for the Council. It appeared that Mr. Brown rebuilt the premises 400 and 402 Coldharbour Lane, Brixton, in the metropolitan borough of Lambeth, within the prescribed distance of the centre of the roadway. The County Council took proceedings, and the builder applied for consent under section 22 of the Building Act. The Council consented to the buildings being erected on condition that the height did not exceed 34 feet 6 inches. In September the appellant desired to build another storey to the height of 11 feet 6 inches; but the Council refused to permit this, and against the refusal the appeal was lodged. After argument, the Chairman said the tribunal were of opinion that their rules, which had been approved by the Lord Chancellor, should be strictly adhered to. They had no jurisdiction to sanction a departure from these rules, and in that case there had been no sufficient compliance. They must dismiss the appeal, and allow the Council ten guineas costs.

NEW HOSPITAL FOR LEEDS.

THE new buildings which will form a women's and children's hospital in Leeds are now proceeding rapidly, the committee having decided to go on with the work, although the whole of the necessary funds are not yet in hand.

The existing buildings, near the infirmary and St. George's Church, are now so inadequate, not to say obsolete, that the

duty of providing better and larger accommodation has become imperative. The new hospital will, it is hoped, provide all that is necessary, on the most approved and up-to-date plan, for a long time.

The designs are those of Messrs. Chorley, Cannon & Chorley, of Leeds, with Mr. A. Graham, of London, as consulting architect.

The building will be divided into three departments—the out-patients' block, the hospital block and the administrative block. The last mentioned will be the existing building until such time as the generosity of donors enables the committee to provide a new building for administrative purposes in keeping with the rest of the hospital.

The out-patients' department is planned entirely on the ground floor, and will be quite independent of the hospital proper. The communication will be for the convenience of the staff only. The accommodation here comprises a large and well-lighted out-patients' hall, shelter for perambulators and so on, rooms for consulting, examinations, registration, the dispensing of medicines and other purposes.

The hospital proper is on four floors. The basement will be used for storage purposes, and on the ground floor there will be a large entrance hall, board-room, secretary's office, waiting-room, porter's room and other rooms. A wing, approached by a corridor, will comprise a large ward for twenty beds, one of three beds and a single bed ward, together with the necessary bath-rooms, lavatories and other offices. A special feature of all the wards will be that everywhere, walls and ceilings, the angles will be curved, the aim being to get rid, as far as possible, of every angle or corner in which infectious dust might accumulate. On the floor above will be other wards, similarly arranged, the whole providing for forty-eight in-patients on the two floors. Here also is accommodation for the resident surgeon, whilst a wing for operations will embrace an anæsthetising room, a sterilising recess, a recovery room and a cloak-room. A special feature of the operating-room will be the method of lighting adopted.

The second floor will be devoted to a complete suite of small wards for isolation and other purposes. The wards will be heated by open fireplaces in the centre of the rooms, steam coils being also provided for very severe weather. All the ward windows will be double, so as to avoid draughts. At the same time adequate ventilation will be provided.

Lastly, outside will be a mortuary, fitted specially with a view to pathological and autoptical examinations.

The whole cost will be about 24,000*l.*, and of this about 6,000*l.* are still required. Without this sum the building cannot be efficiently and properly equipped. So valuable is the work done by the hospital, and so steadily is it increasing, that there is little doubt that the generosity of Leeds and its neighbourhood will provide the funds necessary to enable the hospital to carry on the good work it has done in the past in an extended form, and under conditions more favourable to the patients than has been the case hitherto.

ADMIRALTY CONTRACTS.

ON Monday an appeal was heard in the House of Lords before the Lord Chancellor, Lord Shand, Lord Davey, Lord Brampton and Lord Robertson (the Attorney-General *v.* Stewards & Co., Ltd.), which casts a light on the methods of Government officials when dealing with contractors. It was an appeal, says the *Times*, from the order of the Court of Appeal (the late Master of the Rolls and Lords Justices Collins and Stirling), dated December 4, 1900, dismissing an appeal from a judgment of Mr. Justice Day's dated January 23, 1900. The respondents on December 29, 1898, presented a petition of right to Her late Majesty praying for payment of 27,386*l.* 17*s.* 4*d.* as damages in respect of the breach of an alleged contract entered into by the Admiralty with the respondents to purchase stone from the respondents at 4*d.* per ton. Judgment was given by Mr. Justice Day for the suppliants on the question of liability, the question of the amount of damages being allowed to stand over, with liberty to apply. In May 1895 the Admiralty were engaged in erecting a breakwater at Portland, known as the Portland new breakwater, and for the purpose of forming the said breakwater they required large quantities of rough stone. They therefore entered into communication with the respondents, who were stone merchants and quarry-owners in the Isle of Portland, and Mr. Macfarlane, who was the Admiralty's superintending civil engineer, at Portland, and, acting with the authority of the Admiralty, had several interviews with Mr. Crabtree, who was the manager of the respondent's quarries, on the subject of the stone which would be required for the purposes of the formation of the breakwater, and Mr. Macfarlane visited the respondents' quarries, and eventually requested the respondents to write to him as to the terms upon

which they would be willing to supply the Admiralty with the stone. The respondents thereupon, on July 30, 1895, caused the following memorandum to be written and sent to Mr. Macfarlane:—

"Memorandum. D.W. 6,427. From Stewards & Co., Ltd., stone merchants, Portland. Quarry Office: July 30, 1895. To the Engineer, Breakwater, Portland. Dear Sir,—We are willing to supply the cap and roach stone now lying in rough stacks in our quarries to the Admiralty for the new breakwater works at the rate of 4*d.* (fourpence) per ton. The Admiralty to provide all necessary plant and bear all expense in loading and removing same so as not to interfere with our quarrying operations. The net weight of stone to be taken by passing waggons over Admiralty weighbridge.—We are, yours very truly, for Stewards & Co., Ltd. R. H. CRABTREE."

In August 1895 the respondents received the following communications from the Admiralty:—

"D. W. 7333. Reference Sheet. From Supertg. Civil Engineer, Her Majesty's Breakwater at Portland, August 26, 1895. Information required or notified. Portland New Breakwater, Supply of Cap and Roach Stone.—You are invited to submit a tender for the supply of the above stone, particulars of which are enclosed. The tender to be made on the enclosed form and forwarded to the address stated thereon, so as to be received in London by noon of Tuesday, September 10, 1895.—D. MACFARLANE, Suptg. Civil Engineer."

The enclosed form was headed "reference sheet," and was described in the arguments and judgments as the "specification":—

"From Supt. Civil Engineering, Her Majesty's Breakwater, Portland. Dated August 26, 1895. Portland New Breakwater.—Tenders are invited for the supply of cap and roach stone now lying in rough stacks in quarries, in such quantities and at such times as may be required by the Admiralty. Price to be stated at per ton, which is to include all necessary wayleave with permission to lay railways or other roads over or under existing railways between the stacks and through any lands belonging to other quarry-owners, to open up direct communication between contractors' stone heaps and Admiralty lands. The Admiralty will lay their own railways, provide all necessary plant for loading and transporting stone. Stone will be paid for at weights ascertained by passing loaded waggons over Admiralty weighbridges. Contractors to mark on tracing provided the site of their stacks and indicate the route along which the stone can be transported to Admiralty depot."

Contractors to state the approximate quantity of stone they are able to supply."

The respondents filled up the following form of tender, of which the outlines were printed:—

"Director of Works' Department.—We, the undersigned, do hereby agree to deliver (see plan annexed) cap and roach stone (rough) approximate amount two million tons, in accordance with specification for the sum of 4*d.* per ton. (It is believed that a considerably larger amount is obtainable, but as the amount required is not stated we have not verified this.) Dated this 7th day of September, 1895. Signature of Contractor—Stewards & Co., Ltd. Trade or Profession—Stone Merchants and Quarry-Owners. Address—Isle of Portland. The Director of Works, Admiralty, 21 Craven Street, London, W.C. Note.—This tender must be delivered, addressed as above, sealed and marked 'Tender for cap and roach stone for new breakwater,' by noon on September 10, 1895, and no notice will be taken of it if received afterwards."

On October 2, 1895, the Admiralty, through their Director of Works, wrote and sent to the respondents the following letter:—

"Director of Works, Royal Navy, No. 8272-6409. Admiralty, 21 Craven Street, Charing Cross, W.C., October 2, 1895. Gentlemen,—I have to acquaint you that your tender, dated September 7, 1895, is accepted for the supply for the new breakwater at Portland of about 2,000,000 tons, or such quantity as may be required, of cap and roach stone (rough), in accordance with specification at the rate of 4*d.* per ton, on the understanding that the stone be taken in such quantities and from such positions as may be considered by the Admiralty superintending officer the most desirable for the Admiralty works. Your claim should be made out on the attached Form D. 146, and forwarded with the goods to the officer in charge of works for his certificate.—I am, your obedient servant, C. COLSON, for Director of Works, D. Macfarlane, S.C.E., No. 1236. Messrs. Stewards & Co., Ltd., Stone Merchants and Quarry-Owners, Quarry Office, Portland."

Afterwards the Admiralty, in pursuance of the above tender and acceptance of tender, laid their own railways through and upon the respondents' lands in the Isle of Portland in order to open direct communication between the respondents' stone heaps and the Admiralty lands, and the respondents commenced supplying cap and roach stone to the Admiralty for the purposes of the breakwater in accordance with the above tender and acceptance of tender, and continued to do so until

January 15, 1898, and the Admiralty accepted the stone so supplied, and paid for the same in accordance with the said tender and acceptance of tender. On December 23, 1897, Mr. Macfarlane, on behalf of the Admiralty, and with their authority, wrote and sent to the respondents a notice as follows:—

"From Suptg. Civil Engineer (Works Loan), Her Majesty's Breakwater, No. 1336 at Portland, December 23, 1897. Gentlemen,—As the Admiralty have entered into a contract with Messrs. W. Hill & Co. for the completion of the new breakwater works, will you please note that the Admiralty will cease to draw stone from your stone heaps after January 15 next. From that date all work will be carried on by the contractors subject to any arrangement they may make with you.—Yours faithfully (Sgd.) D. MACFARLANE, Superintending Civil Engineer. Messrs. Stewards & Co., Ltd., Portland."

After January 15, 1898, the Admiralty ceased to draw stone from the respondents' stone heaps, and refused to receive any further supply of cap and roach stone from the respondents, and the Portland new breakwater works have ever since been and are now being carried on by Messrs. W. Hill & Co. The respondents had supplied to the Admiralty 254,928 tons 8 cwt. and 2 qr. of the cap and roach stone required for the purposes of the breakwater. At the trial the appellants contended that there was no contract at all, or, at any rate, no contract to take what was required for the breakwater up to 2,000,000 tons, or at all; that the Admiralty were at all times at liberty to procure their supply of stone for the breakwater elsewhere, and that if there was any contract there was no breach of such contract. The respondents contended that there was a contract and a distinct breach of such contract. The case was argued on Thursday and Friday last by the Attorney-General (Sir R. B. Finlay, K.C.) and Mr. R. B. D. Acland for the appellants; and by Sir R. T. Reid, K.C., Mr. Cyril Dodd, K.C., and Mr. T. J. Bullen for the respondents. Their lordships gave judgment, allowing the appeal.

The Lord Chancellor said that it was matter of regret that the burden should be imposed on the Courts of interpreting such irregular and inappropriate documents as those in the present case. The difficulties which pressed upon their lordships in the construction of these three documents were so great that either side of the question might be plausibly argued. Their lordships were asked to spell out the intention of the parties, not from any concluded contract, but from a number of papers, all of which must be examined and read together for

the purpose. There was a quantity of material of so inferior a quality that the owners wished to get rid of it. On the other hand, the Admiralty wanted to get as cheaply as possible the kind of stone which they needed, that stone not being of a superior quality. The Department accordingly sent a circular to ascertain at what price they could buy the stone "at such times and in such quantities" as they required. The contractors were also requested to state how much they could supply. Up to this point the matter was free from doubt. Then came the form of tender, which was partly written and partly in print. There in this form the contractors gave the approximate amount which they could supply as 2,000,000 tons. In the acceptance of the tender there was no undertaking to accept 2,000,000 tons. In his lordship's opinion in these two instruments there was no contractual obligation to take 2,000,000 tons, but only to take stone in such quantities and at such times as the Admiralty might require; that was, that the contractors were to supply the stone in the quantities specified from time to time when the Admiralty demanded it. There was at no time an undertaking to take a definite quantity. The Master of the Rolls and Lord Justice Stirling arrived at a different conclusion, but expressed some misgiving. But for the reasons which he had stated, though with some reluctance, his lordship came to the conclusion that the decision of the Court of Appeal should be reversed, and he so moved their lordships.

Lord Shand gave a short judgment to the same effect.

Lord Davey said that the construction of the three documents on which the decision of the appeal depended was undoubtedly difficult. The learned judge who tried the petition of right and all the judges of the Court of Appeal had taken one view, and all their lordships had arrived at a different conclusion. For himself his lordship owned that his mind had fluctuated, and that the conclusion at which he had arrived was at variance with his first impression. The first document was called a specification, though it was really nothing more than an invitation to the public concerned to supply the material wanted. The words were "tenders are invited for the supply of cap and roach stone now lying in rough stacks in quarries;" not, it would be observed, for any particular quantity, but "in such quantities and at such times as may be required by the Admiralty." Grammatically the words "in such quantities," &c., must be read in connection with the word "supply." Then there were the words "contractors to state the approximate quantity of stone they are able to supply";

not, it would be again observed, "which they are willing to offer to supply," but "able to supply." The object was obviously to enable the Admiralty to ascertain the extent of the supply upon which they could rely from any particular quarry. It was a crucial point that persons were not asked to supply any particular quantity. His lordship then read the tender of the respondents, which he thought might be paraphrased thus:—"We agree to supply stone in such quantities and at such times as may be required by the Admiralty not exceeding the approximate amount of two million tons at 4d. a ton. We believe we can supply more if required, but we have not thought it worth while at present to verify this." His lordship then read the answer of the Admiralty, which was the third document in question. The argument had turned on the words "as may be required." The Attorney-General maintained that they meant "as may be required by the Admiralty"; the respondents read the words to mean "as may be required for the purposes of the breakwater." If he read the tender and acceptance alone he should probably be in favour of the respondents; but there were difficulties in either construction. If the respondents' construction were adopted, they would be bound to supply more than 2,000,000 tons, though they had expressly guarded against committing themselves to a larger quantity. On the Attorney-General's construction, it was not an acceptance of the offer, which read alone was a tender for a definite supply of 2,000,000 tons more or less. Reading the three documents together, he had come to the conclusion that the words meant "or such less quantity as may be required by the Admiralty from time to time." He agreed with their lordships that the appeal should be allowed, and would only add that he did not dissent from the general observations which the Lord Chancellor made at the beginning of his judgment, and that it was to be lamented that a public department should not succeed in making its contracts in words on which there could be no question.

Lord Brampton read a judgment to the same effect.

Lord Robertson was of the same opinion, and after reading the three documents—the specification, the tender and the acceptance—pointed out that although the specification was headed "Portland New Breakwater," nothing was said about the nature and extent of the works or as to the amount of stone likely to be used in the breakwater. The argument had really turned on the words "as may be required" in the acceptance; and these he took to mean as may be required by the Admiralty in the sense of demanded by the Admiralty.

THE WEEK.

THE deputation of members of the Royal Hibernian Academy that was received by the Lord-Lieutenant on Monday were obliged to describe a condition of affairs which is discreditable to Ireland. The gentry of the island do not care for art, and consequently do not in any way aid in upholding the only Academy of Arts which exists. There are no subscriptions or donations towards the necessary expenses, the exhibitions are visited by a comparatively few people, and the works which are shown on the walls are not purchased. The Academy was founded at the expense of an Irish architect, FRANCIS JOHNSTON, who laid out about 14,000*l.* on it, and then presented the property to his countrymen, who were incompetent to appreciate the gift. Judging by the way the Irish people have acted, they must believe that, as the Academy was created without any cost to them, it can continue to exist without their aid. It is assumed by the Academicians that as the street in which the building is placed is now outside the fashionable area the public refrain from going to the exhibitions on that account. But considering how numerous are the means of communication in Dublin, the belief, if not fear, only a fallacy. So long as the Irish people continue to be indifferent to art the exhibitions will be deserted regardless of the part of the city in which they are held. The question is therefore whether it is the duty of the Government to support an institution which is more advanced in its teaching than the ordinary art schools, in the hope that at a future time more interest will be taken in art than at present. The contribution from the Treasury has been given amounts to no more than 300*l.* a year, and it has been an open secret that South Kensington was in favour of the withdrawal of that modest aid. It may have been considered that when deprived of support the people would be forced to come to the rescue of the Academy, but it is a vain hope. The Lord Lieutenant sympathises with the Academicians and is disposed to support the project for the removal of the Academy to some other place. That would be an experiment which may be worth trying, though it is very doubtful whether it would be a means to success.

LAST week we referred to the action brought by Messrs. EDWARDS & CO. against the Admiralty, and which turned on the expression "such quantity as may be required." The plaintiffs were unsuccessful, and, as we remarked, "the case should serve as a warning, for it shows the necessity of precision in the phraseology of contracts relating to materials." Another case, which turned on phraseology as well as on quantities expressed by figures, was decided on Tuesday by Mr. Justice WALTON. It related to the Baker Street and Waterloo Railway. The plaintiffs, Messrs. ELBOURNE & CO., sued Messrs. PERRY & CO. for damages because they were not allowed to remove the entire quantity of material they had contracted to cast away. It was agreed between the parties that the plaintiffs were to remove the excavated material from the Oxford Street Piccadilly shafts at 3*s.* 10*d.* a load. During the progress of the works there was a change in the manner of driving the tunnel, and instead of the material excavated being sent to the Piccadilly shaft it was sent to a shaft by the side of the river. In consequence the quantity carried away by the plaintiffs was reduced. According to the contract deed, plaintiffs were to provide necessary horses, carts, men and plant for the removal of the whole of the surplus earth, clay or rubbish from the sites or shafts at any rate, quantity, or number of loads required by the contractor. The plaintiffs claimed that they were entitled to remove 138,000 cubic yards of stuff, an approximate quantity which was stated in the application for a quotation for carting, while the defendants said they were only bound to allow the plaintiffs to cart the material which it was convenient to remove through the shafts. Mr. Justice WALTON came to the conclusion that there was nothing in the contract binding the defendants to do the work in any particular manner, or giving the

plaintiffs the right to have any particular quantity of material removed at the Piccadilly and Oxford Street shafts. Judgment was accordingly given for the defendants with costs. The litigation, in our opinion, could have been avoided if in the contract-deed the approximate quantities, 85,000 and 53,000 cubic yards, had been inserted, with the proviso that the same rate would be charged if the quantities were increased.

THERE is some commotion among architects, archaeologists and the numerous Germans who are proud of Strasbourg Cathedral about the propositions which have been made for heating the building. There seems to be no opposition among the different authorities, secular and ecclesiastical, who share in the responsibility for the safety of the minster, and it is moreover recognised that the heating of so vast a space is a difficult scientific problem. But as there is a general impression that the building has been very delicately constructed—for it is all supposed to be in keeping with the pulpit, which does not seem strong enough to support a preacher—there is an apprehension that any weakening of the stone might bring about a collapse. So acute are the anxieties of some enthusiasts, they are confident that even the dust which may arise from one system of heating will have a most injurious effect on the masonry, and that sooner or later serious consequences must be looked for. It is also feared that if other systems are employed there may be slight accumulations of soot which will be no less dangerous. In fact, it may be said that every system that has been proposed has given rise to opposition. Among officials there is a belief that the difficulties can be overcome by hot-water heating, but how that is to be accomplished without the erection of unsightly apparatus is not evident. The Germans know more about the theory of heating than most people, but it must be allowed that in their practical applications of science for warming buildings they have not been as successful as Englishmen or Americans.

At the French Ministry of Public Instruction and Fine Arts the subject of an exhibition of ancient Persian work is now under consideration. During the past few years M. DE MORGAN, who distinguished himself as an explorer in Egypt, has been engaged in investigations in Persia. Over 200 large cases containing the spoils of his excavations have been sent by him to the Louvre. In addition to bricks bearing cuneiform inscriptions are bas-reliefs in stone and bronze, bronze arms and other instruments, slabs, several varieties of ceramics, statuettes of clay, alabaster, ivory and jewellery mostly of massive forms. The treasures are conjectured to date from a period antecedent to the invasion of Persia by ALEXANDER THE GREAT. There are other works which belong to a still earlier time, and some inscriptions are said to have been produced 6,000 years ago. The new discoveries, added to those which were made by M. and M^{me}. DIEULAFOY, will enable the authorities of the Louvre to give an adequate representation of ancient Persian art which will far exceed in interest any other in Europe.

THE London, Brighton and South Coast Railway Company having announced their intention to erect new workshops, received applications from many towns in Sussex, and sites were offered on terms that were supposed to be advantageous. After long deliberation Lancing has been selected. As the place lies between Worthing and Shoreham it is not remote from the terminus at Brighton. The land acquired is of sufficient area to allow of future extensions. At present it is proposed to erect workshops for the production of carriages and waggons only. Locomotives will continue to be made at Brighton. Probably between three and four hundred men will be employed, and the number may be increased hereafter. As many of the artificers live at Brighton and may not care to remove from that watering-place, it is proposed to run special trains in which the men will be conveyed backwards and forwards without payment.

THE ADMINISTRATION OF ROADS.

THE condition of the English highways was a constant subject of complaint by travellers in the eighteenth century, as well as by ordinary letter writers. No doubt it was constantly referred to in conversations. It was only with difficulty a carriage could travel at the rate of six or seven miles an hour. In some districts two carriages could not pass on a main road. So unsatisfactory an obstacle to freedom of motion was undoubtedly caused by the peculiar system adopted for constructing or, rather, for repairing roads, as new means of communication were not favoured. Although the king's highway was not always easily defined, it was a generally accepted opinion among lawyers that once a road was so recognised it could not change its character unless through the operation of a special writ granted after an inquiry. The maintenance of highways was by common law the duty of the occupiers of lands or tenements within a parish or township. That system was not always found to work efficiently, and in 1653 a Turnpike Act was passed in order to lighten the burden on the parishes by making those who used the roads contribute to the expense of keeping them in a fitting condition. There were drawbacks to the new method, but it continued in force until a very recent period.

It is, however, dangerous to interfere with authority in England, and the administration of the highways still recalls the old days when the character of the miry roads depended on parish labour that was grudgingly exercised. The parish may no longer in all cases be accepted as the normal area, but there is a littleness about the existing divisions which has the parochial impress. For example, Lancashire has 151 highway districts, each with its authorities. The road from the City of London to Uxbridge, *i.e.* the old Oxford road, in the course of twenty miles comes under the control of twelve legally constituted bands of guardians, and the Bath road between Piccadilly and Slough admits of ten authorities within twenty miles. It may be contended that these are exceptional cases; but there is no doubt that in England and Wales there are 1,879 regularly elected bodies who exercise sway over the roads in their districts, and who can have the works executed in any way that is considered best, or, in other words, on the most economical terms for the local area. It is no wonder, therefore, that so much variety is to be seen in the nature of the highways, and that reparations are carried out at very varying rates.

One disadvantage of the present system is that expenditure is only regarded, as it were, by fractions. There is grumbling periodically at meetings of county or divisional councils about the sums which have to be forthcoming for work on roads. Few care to realise what the outlay is when treated as a whole. It may surprise many of our readers when they learn that in the year 1898-99 no less a sum than 8,434,000*l.* was expended on the maintenance of streets and roads in England and Wales, including scavenging and watering, and exclusive of 2,127,000*l.* spent out of loans. Whether the ten and a half millions have been wisely laid out is a question about which there is diversity of opinions. Anyone who has lived in the provinces must often have been amused at the election of men for road surveyors who could not claim to have possessed any technical training. Cases are recorded of agents, clerks and gardeners having received such appointments, which they courageously undertook without any misgiving about their fitness. In some places the salary given is not sufficient to attract qualified surveyors. When we hear that a sum of 62*l.* 10*s.* a year, which is to include all travelling expenses, is offered as remuneration for taking charge of 114 miles of road, it is not to be expected that an efficient surveyor will accept the appointment, or, if one is secured, that he will devote all his energies to the promotion of economy and satisfactory work.

A statement has been prepared and laid before the President of the Local Government Board by the Roads Improvement Association which describes the shortcomings of the existing system from other sides, in addition to that of expense. It is said, for instance, that as there is no authority to determine the width of main roads or those "leading out of the great towns, the building line has been permitted to approach far too near the centre of the road, with the result that as the town grows and the traffic in-

creases, the buildings will have to be set back at enormous expense—an expense which would have been rendered quite unnecessary had a central authority existed with power to prescribe the minimum width of main roads to prevent encroachments." The traffic on roads has become of a heavier character than formerly, owing to employment of traction engines, motor-cars and rollers of various kinds. The old-fashioned masonry bridge can in most cases withstand the increased weight, but it is pointed out that "no machinery appears to exist at the present time for compelling the authorities who are responsible for the upkeep of bridges to strengthen them in order to carry traffic which can now be considered normal, and in the majority of cases the spirit of parochialism which exists with regard to roads has been equally apparent with regard to bridges." Of much less importance are sign-posts and mile-stones, but everyone who has made journeys on bicycles is aware of the imperfect condition in which those indicators are generally to be found. At road junctions one or more arms of a post will be absent, and often quite evident from the state of the wood that the inconvenience has endured for many years.

At the present time several industries have to suffer through defective roads, and agriculture perhaps most of all. French centralisation may have its disadvantages, but it can be no question that it has intersected the country with an admirable network of roads. An American official, reporting to his Government a few years ago, wrote:—"The road system of France has been of far greater value to the country as a means of raising the value of lands and putting the small peasant proprietors in easy communication with their markets than have the railways. It is the opinion of well-informed Frenchmen who have made a practical study of economic problems, that the superb roads of France have been one of the most steady and potent contributions to the material development of the marvel of the financial elasticity of the country. The far-reaching and splendidly maintained road system has distinctly favoured the success of the small landed proprietors, and in the prosperity and the ensuing distribution of wealth lies the key to the secret of the wonderful financial vitality and prosperity of the French nation."

The pressing problem of housing the humbler classes is also related to road-making, for with good roads it is easier to make arrangements by which working men and women will be conveyed more expeditiously to and from their place of employment. When dealing with this subject we ought also to remember that in a country like England some thought should be given to the connection between roads and national defence. If, as Napoleon said, the art of war consists in having more forces than the enemy at the point where he attacks or is attacked, the result depends in a large measure on the character of the roads along which the troops must pass. A great number of battles had, consequently, for their object the possession of roads, and, according to the Association's statement, the coast road in this country "along which men and guns could be rapidly moved to any threatened point would be one of the cheapest and most effective protections against invasion."

The aim of the Association is to form a central authority that would be supreme, and that would have power to take action in cases where the local authorities have failed to do so. It is declared that it would not be necessary to supersede the existing local authorities any more than the School Boards have been displaced by the Education Department or Poor Law Guardians by the Local Government Board. It is believed that in many instances an advantage would be gained if there existed a central authority able to treat the subject of road construction, maintenance from all points of view, and that would prescribe rules and regulations which would be the outcome of experiments and inquiry. A department of this kind usually means grants out of Imperial taxation, and it is proposed by the Association that one-half of the cost of maintenance of main roads of England and Wales, one-half of the salaries of road surveyors and municipal engineers, should come out of the Imperial taxes. Highway authorities would be constituted, who would have jurisdiction and rating powers over large areas. A Metropolitan Highway Authority, for example, would

to control all the main roads within a radius of miles of St. Paul's. There would be only one authority Lancashire, which has now 151, or one for Lancashire and Cheshire united. The new highway authorities would have power to vary and to determine the direction of all new roads and to be under obligation to draw up schemes for the development of the districts under their control, to which all those engaged in building operations and the planning out of building estates would be required to conform, so that as the cities develop new main roads parallel to and alternative to the existing ones would be formed.

It is needless to say that such an arrangement as is proposed by the Roads Improvement Association would be nothing less than a revolution of the English system of government. Parochialism or vestrydom has no doubt its shortcomings, but it has enabled a large body of men to take an interest in the public service, and it cannot be said that those unpaid authorities think mainly of their individual gain. The surveyors and officers they elect are men untrained when they begin their duties, but practice makes an excellent teacher, and it is no difficult task to master the mysteries of road-making in a limited period. It must also be allowed by those who are acquainted with the instruction that at the present time there are no more earnest students of engineering and no more ardent advocates of improvements than borough surveyors and county surveyors. The volumes of proceedings of the societies of municipal engineers contain more information on subjects connected with highway administration than is to be found in special treatises. That information is published in various forms, and we suppose there is not a road surveyor in the kingdom who has not benefited by it, though it may only come before him in an abstracted form. Whether the money is always obtainable for the production of improvements is a different question, but it is not apparent how a more liberal expenditure is to be secured by any change in administration. The taxpayer's power of endurance is necessarily limited, and his burdens cannot be lightened by being labelled local taxation and imperial taxation. Whatever the title, the cost of road-making is not likely to be diminished.

Nor is it evident that a more perfect system of construction and maintenance, or more definite information about materials, will be at the disposal of the country by the creation of a new and central authority. Long experience has shown that in no department of engineering has superior information been issued by a Government department. It has usually been experienced that officials believe it is a duty to check improvements by putting obstacles to their adoption. The action of the Board of Trade in regard to steel was enough to reveal the spirit in which high officials act. It had been resolved that the use of steel in structures was to be prohibited and that wrought-iron alone was safe. The Board of Trade could not have acted in any other way, it may be said that the general adoption of steel is in defiance of official regulations. The system adopted by the Post Office in respect of telephones is another example. With such precedents before them, all who have to do with roads must hesitate before yielding supreme control to a department that in a short time would be likely to follow the usual custom of impeding improvements rather than promoting them. The present system is imperfect, but unless officials could be discovered of a class unlike the potentates who now exercise authority in the name of the State, it would be better to allow the old-fashioned highway authorities to muddle through their task.

The sub-committee of the Glasgow Town Council appointed to deal with the decayed stonework of the Municipal Buildings report that the work of restoration is being satisfactorily carried out by Mr. Alexander Muir. Some parts of the building are much further decayed than others that it will be requisite in a number of places to remove some stones and replace them with new masonry, in order to preserve the architectural character of the different façades in accordance with the original design. In view of the expert advice they have received, the sub-committee have every cause to believe that the methods adopted by Mr. Muir will effectually arrest the decay of the external surfaces of the building, and leave it in a good and presentable condition.

THE FORTIFIED PRIORY OF EWENNY.*

THERE are churches in England which are as old as St. Michael's, Ewenny, and some which are as interesting in an historical sense, but it may be doubted whether there is another to be found which is so striking an example of the fortified church which became indispensable in some districts after the Norman Invasion. The CONQUEROR had subjected Wales and compelled the princes to acknowledge his suzerainty, but after his death the Welsh crossed the English Border and devastated the country. About the same time the Prince of CAERMARTHEN or DINEVOR quarrelled with the Prince of GLAMORGAN. The latter engaged ROBERT FITZHAMON of Gloucester, with his Norman followers, to take his part. The Prince of CAERMARTHEN was attacked, defeated and slain. The Normans were then sent back to England, but a Welshman named EINEON, who had negotiated for the strangers' interference, found himself unrewarded. He therefore persuaded FITZHAMON to come again, and eventually Glamorgan became subjected to the Norman knight, and after the manner of his sovereign lord, WILLIAM, he divided the country among his followers. The Welsh were not, however, satisfied with the foreign system of feudalism which was introduced. There was an outbreak, and FITZHAMON was surprised in Cardiff Castle by the natives, who were commanded by DE TURBERVILL, of Coity, who was also a Norman. For a time the foreign rule was jeopardised.

In order to secure their position, castles were erected to defend the new frontier or marches. Even when a church like Ewenny was founded it assumed a warlike character. The priory owed its origin to MAURICE DE LONDRES, who was among the liegemen of the FITZHAMONS. In one of the old records of Glamorgan it is stated that, "In the year 1141 MAURICE DE LONDONIA, the son of WILLIAM DE LONDONIA, gave to the church of St. Peter of Gloucester the church of St. Michael of Ewenny, the church of St. Bridget with the chapel of Ugemore de Lansey, the church of St. Michael of Colvestone, with the lands, meadows and all other things belonging unto them, freely and willingly (quite) in free alms, in order that it might become a convent of monks." As the buildings must have required several years to construct, WILLIAM, the father of MAURICE, probably had a share in the undertaking. MAURICE may have resembled many of the knights who were his contemporaries, and who erected churches as an atonement for misdeeds. In 1128 he was threatened with excommunication by the POPE for seizing ecclesiastical property, and a few years before he assigned Ewenny to the Abbey of Gloucester, he had captured a Caermarthen princess, and in defiance of all law or courtesy she was beheaded in the courtyard of his castle. The family did not long endure, for the last of them, HAWISE, died in 1274 and a portion of her tombstone is to be seen in Ewenny Church. A branch of the family followed STRONGBOW to Ireland, and in 1219 one of them, HENRY DE LONDRES, was Archbishop of Dublin, and constituted the collegiate church of St. Patrick into a cathedral, and thus gave the city its unique distinction of a pair of cathedrals. It is worth noting that in a deed of 1126 PAGANUS DE TURBERVILL appears as co-witness with MAURICE DE LONDRES, and the connection of the family of the former with the locality is of old date.

It is remarkable that although Ewenny was constructed, as E. A. FREEMAN says, "as a shrine for men who performed the most solemn rites in fear and trembling amid constant expectation of hostile inroads," there is no record that the resistance of the outer walls was ever tested by an attacking force. For nearly two centuries the Welsh were constantly invading the district. Treaties were entered into but were never respected by either side. Ewenny was somehow held as a sacred place, and the only explanation Colonel TURBERVILL can offer for the phenomenon is that "possibly the religious feeling of the Welsh may have induced them to spare a monastery even when it was combined with a castle."

As it was erected early in the twelfth century Ewenny

* *Ewenny Priory: Monastery and Fortress.* By Colonel J. P. Turbervill. London: Elliot Stock.

exemplified the Norman style, and few or no alterations were made to bring the building into keeping with any or all of the Gothic variations. The part which still remains is the church of the priory. Evidently the building was intended to be used from the first as a parish church as well as a priory chapel. FREEMAN, who took much interest in the building, and in fact directed some reparations, draws a comparison between it and Dunster Church:—

Dunster, of which we have the history, gives the key to Ewenny in Glamorganshire. Here, unlike Dunster, part both of the monastic and parochial church has been destroyed, but enough is left to show the distinction in the most marked way. The western limb of a cross-church forms the parish church, fenced off by a solid reredos across the western arch of the tower. The monks' choir is fenced off by another open screen across the eastern arch, just as at Dunster. The transept and crossing are, as they once were at Dunster, neutral. Since the "restoration" of Dunster, Ewenny—unless that too has been "restored" out of its historical value since I was last there—remains the most perfect example of churches of the class.

MALLARD TURNER found his way to Ewenny between 1790 and 1800, and made a drawing of the church as it then was. If it were not for the light screen, which is Gothic, the semicircular vaults might be assumed to have been derived from some colossal Roman work. But the scale of the building was magnified by the painter. The condition of the church at the time is suggested by the pigs and fowls and their attendants. TURNER could also have introduced cattle, for a part of the building was used as a cowshed, and there are cuts in the screen that were worn in the wood by the ropes with which the cattle were secured. As the chapel was restored in 1895 under the direction of Mr. MICKLETHWAITE, it is now in a more becoming state, and retains as much of its ancient character as was possible. The lighting is peculiarly dim and religious, for the windows were made of very small size by the Norman builders. The tower is low and massive, and is surmounted by stepped battlements, each of which is pierced with a cross eyelet.

The present aspect of the church differs greatly from what was seen by those who went to Ewenny a century ago. Captain GROSE, the admired of ROBERT BURNS, who visited the church in 1775, wrote:—"It is at present horribly defaced by a filthy custom which prevails in many parts of this country, namely, the making of raised graves on the floor of the churches, and strewing flowers and herbs over the graves; these flowers soon decay, become like dung, which, with the bones and pieces of broken coffins thrown about, afford a very disgusting sight, and must be extremely unwholesome." DONOVAN, writing in 1805, prophesied the downfall of the whole roof within a short time. "The nave which was used for Church service betrayed," he said, "every symptom of neglect as well as of innovation, and as a place of worship nothing could be more disgraceful." He continues:—"For the want of a few score tiles on the broken roof the congregation when assembled are exposed in all weathers to the open day, and, what must prove still more disgusting, to the filth occasioned by a busy swarm of pigeons kept about the priory, whose dung falls at intervals into the church, where it accumulates through neglect and is suffered to soil the furniture of the pulpit, the pews, the floor and even the communion table in the most unbecoming manner." While the church was in that state a costly house was in course of erection for the owner behind the old priory house.

Colonel TURBERVILL has traced out the fortifications as they were. The enclosure was almost a parallelogram having an area of nearly 5 acres, the length being 190 yards and the breadth 130 yards. An impending danger was on the north side, where the hills stood from which the Welsh descended. There was an outer court with a round tower at one angle. The principal tower guarded the entrance from the river side. There were in connection with it a triple portcullis, iron doors and provision in the walls for the insertion of huge beams. There were also several other towers, but it is said that "the greatest difficulty which presents itself when considering the defensive power of the place is the great number of men-at-arms which it would have required to defend so great an extent of wall against an active and numerous besieging force."

It is impossible to ascertain what number of monks was provided for in the establishment. So solitary position called for the aid of numerous auxiliaries, and the part of the church which was for the use of the monks measures 42 feet 7 inches by 22 feet 2 inches, there likely to have been accommodation for several. When in 1534 the community gave a unanimous consent to King HENRY's headship of the English Church, and declare that the Bishop of ROME had no more authority in England than any other foreign bishop, there were only two monks and the prior at Ewenny. Colonel TURBERVILL says that one must wish that the closing scene had been of more glorious nature, for it is with a feeling of shame and sadness that one reads the deed of submission. The priory, with all its belongings, was leased for ninety-nine years to Sir EDWARD CARNE, who was to provide a prior and keep the buildings in repair. In 1546 he bought the property for 727*l.* 6*s.* 4*d.* By the grant CARNE was made absolute owner, and could, if he pleased, have demolished all the buildings and sold the materials. He was one of the clever time-servers who contrived to hold office in the hazardous period. He was employed by HENRY VIII. to visit Rome and serve as agent in the divorce case. He took a profitable share in the dissolution of the monasteries. He was made Chancellor of Salisbury. Queen MARY held him in much in favour as her father did, and he was appointed ambassador to Rome by Queen ELIZABETH. He died in that city, and was buried in the church of San Gregorio, a representative of Catholicism. He founded a family which held Ewenny until 1734; then the property was inherited by the TURBERVILLES, from whom it passed to the PICTON who assumed the name of TURBERVILL according to the conditions of the entail. It may not be known to all that the fiery warrior, Sir THOMAS PICTON, who passed through the Peninsular campaign, and was killed at Waterloo, was brother of the owner of Ewenny. The property now belongs to the WARLOW family, descendants by the mother's side, and the author of the present history is Colonel JOHN PICTON (WARLOW) TURBERVILL, who served for twenty-eight years in the Madras army. He is evidently proud of his property, and in narrating its history has set an example which might often be followed with benefit to archaeologists. To many readers the subject he treats will be novel, and whatever may have been the faults of Englishmen, they have always wished to identify their churches with peace, and it was only under extraordinary compulsion and through confusion of thought that the vandalism of the Puritan army was performed. With all their wildness and bitterness against invaders, the Welsh people did not molest the priory of Ewenny, for, in spite of the fortifications, it would not have been difficult for hordes of hairy mountaineers to have demolished every stone in the enclosure. As a rare example of architecture, the descriptions of the buildings cannot fail to be interesting.

LIVERPOOL CATHEDRAL.

A CONFERENCE of the clergy and lay representatives in connection with the rural deanery of Liverpool North was held last week. Mr. R. A. Hampson, secretary of the cathedral committee, read a paper on "The Cathedral Scheme" in which he said that he accepted the invitation to address them on the subject with pleasure. With the exception of London and Rochester, the diocese of Liverpool was the most densely populated in England and Wales, numbering about 1,200,000 persons. Except London, it was the wealthiest diocese in the country. Yet it was the only bishopric that had no cathedral. There could be no doubt that all classes of people should assist in getting a cathedral worthy of this great city, and so remove the one great stumbling-block to the work of the diocese. If they wanted a scheme to be successful, they must not only appeal to the rich, but to everybody. They must kindle enthusiasm that would appeal to rich and poor alike. The cathedral was meant for everybody who resided in the diocese, and that was the reason why subscriptions should be obtained from every class of citizen. The cathedral would be a church for all people irrespective of position in life, and it was intended that it should be useful to the rich as well as to the poor. Mr. Hampson gave a brief history of the bishopric of Liverpool since its formation in 1880, when Bishop Ryle was appointed to the see. Soon after that appointment a new cathedral was suggested, and Mr. Hampson dealt with the development of the various

schemes that had been propounded, and which led to the adoption of St. James's Mount as the site for the proposed cathedral. Speaking of the suitability of this site, he said that mount, the cemetery, and the space covered 22 acres. The whole space across was 660 feet, length 1,450 feet. St. James's Mount was 250 feet wide and 1,100 feet long. The area of the mount was 22 acres. The 22 acres in question formed the only site in the middle of the city that was practically unbuilt upon and available for the purpose. In order that they could better estimate the site, he compared it to that on which St. George's Hall was erected. The land surrounding that building, from Lime Street station on the Haymarket on one side, and from the Library on the north to Ryland's shop on the south, combined with the space occupied with the hall, was only 17 acres. St. James's Mount was 250 feet wide from east to west, and from north to south it was 1,100 feet long. Comparisons were next made with Lichfield Cathedral and St. Luke's Church, Liverpool, and Mr. Hampson contended that the accessibility of St. James's Mount was to be commended. Taking the Church House as the centre of Liverpool, they were three minutes nearer St. James's Mount than to Monument Place. The electric tramcars running in this direction were also very convenient, and would probably be improved. The place was also quiet, and there was no possibility of its peacefulness being very much disturbed. Mr. Hampson made some interesting allusions to the history of St. James's Mount which he gathered from the work of Sir James Picton, and had also been assisted in this respect by his friend Mr. George Bradbury. The committee were desirous of approaching the matter of building a cathedral on the broadest and grandest lines, one which would be representative of the spirit of the age, and should yet compare with buildings of bygone days. They intended to ask the architects to design a building estimated to cost not less than half a million of money. To-day, however, they could only start the great work, and future generations must do the rest. It was expected that a million of money would have to be expended, and half a century gone before the cathedral was finished. The committee intended to act under the best professional advice with regard to selecting an architect or architects to prepare final plans. They were impressed with the importance of adopting the very broadest views with the object of obtaining, if not in our time, a glorious cathedral which should compare with any other in the country, and be a monument of love, labour and sacrifice on the part of the members of the Church and diocese. It was proposed to have two competitions—first a preliminary one, out of which a number of architects would be selected to compete in the final competition. There would be no restriction as to style or character of drawings, which were not to be sent in before June 30 next. It would be at least two years before the foundation-stone could be laid. The committee wished to express their indebtedness to the Liverpool Architectural Society for very valuable suggestions, and they wished to promote a spirit of unity and co-operation throughout the diocese. This great work of building a cathedral, he felt sure, would do more than anything else to encourage a feeling of unity and co-operation among the members of the Church, both laity and clergy. It was only by being united and by consenting to make some sacrifice for the common good, and to promote the common object in view, that this great labour could be accomplished. In conclusion he appealed to all their friends to make not only sacrifice of money, time and labour, but of opinion as well.

CELTIC GOLD ORNAMENTS.

THE following letter from Mr. George Coffey, keeper of Irish antiquities in the Dublin Museum, has appeared in the *Times* :—

With regard to the resolution passed by the Society of Antiquaries of London, November 28 (the *Times*, November 29), as to certain gold ornaments in the British Museum, lately found in Ireland and claimed by the Royal Irish Academy as trustees for our national collection at Dublin, I am surprised to observe that the Society has committed itself to an opinion on an archaeological question concerning which archaeologists are not agreed. The resolution states :—"As remains of the art of the ancient Britons, and having only an accidental connection with Ireland, these relics could be placed nowhere more appropriately than in the British Museum."

This contention was first put forward by Mr. C. H. Read, of the British Museum, the secretary of the Society of Antiquaries, in a written statement to the Treasury commission of inquiry as to these ornaments. I extract the following passage from the printed evidence (page 8) :—

"There is nothing in the character of the work that is specially Irish. On the contrary, the closest analogy for the most particular feature—viz. the gold chains—is seen in an English discovery of the same period—two brooches from Lancashire; and Mr. A. J. Evans, in his paper on the dis-

covery, finds the nearest analogue to the highly ornamental gold collar in a shield from the Thames. Nor even if it be granted that the boat is a model of a coracle—this form of boat was fully as English as it was at a later period Irish—I do not consider that there is any proof, archaeological or otherwise, that this hoard has any but an accidental connection with Ireland."

Here is a most inadequate representation of Mr. Evans's views. Mr. Evans was not of opinion that the collar is of British origin. On the contrary, he was positive that it is Irish work. He does not say in his paper on the discovery that the nearest analogue to the collar is a shield from the Thames. He says that the "nearest approach" to the "snake-like coils" of the ornament is found in a shield from the river Witham. He compares other features with details on objects from England, from Scotland and from Ireland. The compass work of the collar, he points out, is illustrated best by objects from a tomb in the county Meath. The "fine repoussé reliefs" of certain well-known bronze discs found in Ireland, he writes, "suggest more than one analogy with those of the gold collar." Some decorative scrolls on a collar in the collection of the Royal Irish Academy furnish "a distinct indication that both were made in Ireland." Reviewing the whole evidence of the "find," Mr. Evans states, in conclusion, "there is at least no question as to the indigenous Celtic character of the most important relic contained in the Ulster hoard. The hollow gold collar, with its bold repoussé designs, is undoubtedly an ancient Irish fabric, and it is at the same time the finest example existing of this class of work." (*"Archæologia,"* vol. 55, pp. 402-7.)

Thus does an authority so high as Mr. Evans express his distinct opinion that the most important object in the "find" is an Irish fabric. Yet on this question of origin the Society of Antiquaries, with unscientific rashness, has not hesitated to commit itself by resolution to the positive statement, as of an indubitable fact, that the antiquities have but "an accidental connection with Ireland."

The assertion implied in the resolution that late Celtic ornament in Ireland is derived from Britain is as yet a mere assumption. There is no reason why it may not have come, at least in part, direct from the Continent in the same way that, at an earlier period, the Hallstatt style (better represented in Ireland than in Britain) appears to have reached our island. Since the publication of Kemble's "*Horæ Ferales*" many additional objects of the late Celtic period have come to light in Ireland, and the evidence no longer stands where that work left it. In any case local adaptations of late Celtic ornament—for instance, a certain form of late Celtic fibula, hitherto not found outside Ireland—tend to show that the style was in use in Ireland. And whatever be the final judgment on the subject, when more evidence shall be forthcoming it is certain that late Celtic ornament left a marked impression on the early Christian art of Ireland, as seen in the treatment of scrolls, called by Margaret Stokes and others the trumpet pattern.

The preservation in the Irish national collection at Dublin of antiquities of the late Celtic period found in Ireland is, therefore, of no little importance for the history of decorative art in Ireland.

The resolution of the Society of Antiquaries has the following noteworthy passage:—"The Society is of opinion that the cause of archaeology will be best served by the retention of these interesting objects in the central museum of the Empire, where they are accessible to a greater number of students than would be the case elsewhere"—an example of confusion of thought arising from the use of words which do not represent facts. Adopting for the moment the point of view of the Society, I reply that the Museum of Irish Antiquities for the Empire is the National Museum at Dublin. The British Museum can never hope to equal the collection there, either in completeness of series or importance of examples. Students of Irish antiquities must of necessity go to Dublin, and the science of archaeology will be best served by making the collection there as fully representative as possible. This is true generally, and in particular with regard to Irish students, to whom other countries must look for the working out of the archaeological materials of Ireland.

Any attempt to draw a distinction between the movable and the fixed antiquities of a country is unscientific. The logical conclusion from the position taken up by the Society of Antiquaries is that the ancient monuments of Ireland should be removed to London.

The Liverpool Architectural Society's second members' meeting will be held at 6 P.M. on Monday next, the 16th inst., in the Law Library, 41 Castle Street, Mr. C. J. Andersson in the chair. A paper will be read by Mr. C. Brien (of Messrs. Waring & Gillow's) on "Wood Staining and Veneering," illustrated with specimens of woods and stains, and after the paper Mr. James Cook will show with a lantern some slides of French cathedrals.

NOTES AND COMMENTS.

MANY artists in Paris are now looking forward with eagerness for the conditions of a competition in signboards of various kinds which M. EDOUARD DETAILLE, the military painter, has proposed. The Prefect has accepted the suggestion in principle, but the conditions have yet to be formulated. The programme will, of course, include hanging signs. M. DETAILLE will put himself in the place of an ordinary artist and prepare designs. It is expected that the majority of his fellow-members of the Institute will also join in the competition. M. DETAILLE thinks his scheme will be advantageous, not only by the improvements which would be effected in the streets of Paris by the new signs, but also by the extent of the employment which would be given to most classes of artists, such as painters, sculptors, metalworkers and others. M. GÉRÔME, it is well known, condescended to paint one of the signs which were seen in the Old Paris section of the International Exhibition, and the names of other eminent artists are to be found on such panels. Paris was in old days remarkable for the number of signs which hung above the footways in the narrow streets, and the revival, if it could be accomplished, would add to the picturesqueness of the modern city.

It is pointed out by a writer in the *Polytechnic*, one of the American magazines, that the number of large contracting firms in the United States composed partly or wholly of civil engineers has been largely increased during recent years. The writer says that ten times more ability and common sense are required to carry out a design—and to make money by it—than is needed for the designing. The remarks are characteristic of the American spirit. Ingenuity is not greatly prized unless it brings money, and when a man has practical skill he sees no reason why he should not derive from it the utmost advantage. It is not, however, suggested that the engineer-contractor has an easier life than the engineer who confines himself to designing. It is the contractor, it is said, who lies awake at night worrying about disasters, and who sees clearly the impending dangers of fire, storm and flood. Then the labour question is more of a danger in America than in England. A story is told of the erection of a bridge in the Southern States. The men who were engaged were happy until some dispute arose far away in New York. The bridge was nearly completed when a telegram was received from the trades union. The steelwork was left hanging over a treacherous mountain stream, and remained in that position till men who were not in thrall to the union could be discovered. That incident changed a profitable contract into a loss. Considering the peculiar character of American engineers and the ease with which they transform themselves into contractors, it is not surprising that the French Government contemplate sending some of the selected students of the Ecole Polytechnique to study the American ways of doing business. A school, it is said, could be established in New York which would serve French engineers in the same way as the schools in Athens and Rome serve artists and scholars.

THE Petit-Palais in the Champs-Élysées was generally considered by visitors to be one of the most interesting buildings in the last Paris International Exhibition. It has to maintain a comparison with the larger palace of art which was erected on the opposite side of the new road. But there has been no question about the result. After the close of the Exhibition the fate of the Petit-Palais became doubtful, and a great many propositions were made about the best way of utilising it. At length it has been determined that the building is henceforth to be called the Fine Arts Palace of the city of Paris. The title is a sufficient indication of its future use. For many years past the Municipality of Paris have been purchasing works of art from the Salon and other exhibitions. Some of the pictures were used to adorn rooms in the Hôtel de Ville, but the majority have been stowed in various storehouses. The whole of the paintings, statues and etchings will be examined by a commission consisting of the following

artists as members :—MM. BONNAT, BENJAMIN CONSTANT, DETAILLE, CAROLUS-DURAN, FRÉMIET, GÉRÔME, JEAN PAUL LAURENS, MERCIÉ. They will select the work best adapted to represent the good taste of the Municipal Council. Paris will therefore be able to present next year to visitors a collection of examples of the best modern French art which will vie with those to be seen in the Luxembourg Gallery.

THE forty-eighth annual general meeting of the Society of Engineers was held on December 9 at the offices of the Society, 17 Victoria Street, Westminster. The chair was occupied by Mr. CHARLES MASON, president. The following gentlemen were duly elected by ballot, as the Council and officers for 1902, viz.:—President, Mr. PERC GRIFFITH; vice-presidents, Messrs. JAMES PATTEN BARBER, DAVID BUTLER BUTLER and NICHOLAS JAMES WEST; ordinary members of Council, Messrs. JOSEPH BERNAYS, G. A. PRYCE CUXSON, GEORGE A. GOODWIN, W. H. HOLITUM, R. ST. GEORGE MOORE, HENRY SHERLEY-PRICE, JOSEPH WILSON and MAURICE WILSON; hon. sec. and treasurer, Mr. GEORGE BURT; hon. auditor, Mr. SAMUEL WOOD, F.C.A. During the scrutiny the President addressed the meeting bringing before the members the salient points of the work of the past year. He referred to and commented upon the papers which had been read, and announced that the following premiums had been awarded by the Council for papers read during the past session, viz.:—The President's gold medal to Mr. H. ALFRED ROECHLING for his paper on "The Sewage Question during the Last Century," the Bessemer premium of books to Mr. ROGER G. HETHERINGTON for his paper on "The Main Drainage of Ilford," a Society premium of books to Mr. ARTHUR T. ALLEN for his paper on "Concrete Subways for Underground Pipes," a Society premium of books to Mr. SYDNEY A. HOLLIS for his paper on "Preliminary Investigations for Water Supply," and a Society premium of books to Mr. J. FREEBAIRN STOW for his paper on "Irrigation Works in South Africa." The President also alluded to the visits which had been made to works of professional interest during the year. These were:—On June 12 to the engineering works of Messrs. FRASER & CHALMERS at Erith, and to the air-compressing station of the Shone system of sewage ejection at the same place; on July 18 to the works of the Staines reservoirs, and on September 25 to the School of Military Engineering at Chatham.

SEVERAL Bills relating to London will be brought before Parliament in the ensuing session. Although it may not be considered the most important, if gauged by the outline involved, not one of the Bills will be accompanied with so much approval and sincere wishes for its success from the inhabitants of the Metropolis as that promoted by the Corporation in order to control the breaking up the streets. One section proposes that notices shall be required of not less than three months before the opening of any street together with plans and sections. The notice is to be published in the thoroughfares affected. The Corporation are to prescribe the sequence in which streets may be opened and the conditions under which the work may be performed. The reopening of any street is to be prohibited for a period of nine months from the completion of any previous work in it without the consent of the Corporation or except in cases of emergency. There will be penalties for infringement of the regulations, and in case of disagreement there is to be power of arbitration by the Board of Trade. The effect of the regulations will be to cause more foresight than is now exercised by gas, water and other privileged companies who have the privilege of operating on the streets whenever they please.

CATHEDRAL SERIES.—CHICHESTER: THE NAVAL NAVAL ARCHES

ROYAL HIBERNIAN ACADEMY.

A DEPUTATION representing the Royal Hibernian Academy waited on the Lord-Lieutenant at Dublin Castle on Monday for the purpose of urging their claim to increased State support, and pointing out certain reforms which are considered essential in the interests of the Academy. The following report of the interview is taken from the *Irish Times*.

The deputation consisted of the following members and associates:—

Sir Thomas Drew, president; S. Catterson Smith, secretary; P. Vincent Duffy, treasurer; Nathaniel Hone, James Brennan, Bingham M'Guinness, Henry C. Tisdall, Alfred Grey, R. T. Moynan, Joseph M. Kavanagh, Henry Allan, R. S. Shore, Charles Russell, Geo. C. Ashlin, Alex. Williams, J. Butler Yeats and J. Howard Pentland, members; Thomas Manly Deane, Fred. Batchelor, A. E. Murray, Nassau B. Browne, associates.

Sir Thomas Drew said the statement which he was about to make was intended to correct some misapprehensions about the Academy in the public and the official mind. The Academy was an institution on the lines of the Royal Scottish Academy, and its main purpose was the holding of exhibitions of living and contemporary art. There was some reason for pressing this point. There had been an impression for years that the Academy had not been as well supported by the State as it might be, and that it was not altogether popular with the authorities. He knew, as a matter of fact, that that impression really existed, because it had been conveyed to him officially that several times it was in contemplation to withdraw the small grant of 300*l.* a year which it now enjoyed. Last year it was in contemplation to withdraw the grant, and when he made inquiry as to the reason he was informed that it was reported that the Academy was not doing good work. The impression, it appeared, had got abroad in Government departments and in official quarters during the last 30 years that the Academy was a mere teaching school, whereas its first and main object was to hold exhibitions of living and contemporary art which no other institution in the country did or could hold. That purpose was fulfilled by the Royal Scottish Academy, the Royal Academy of London, and the great municipalities which were doing the same work. Continuing, Sir Thomas Drew read the following statement:—On assuming responsibility as President of the Royal Hibernian Academy a year ago, I had the honour to submit to your Excellency, as its vice-patron and representative of Her Most Gracious Majesty, a statement of the affairs and financial position of that institution, which had been under the grave consideration of myself and colleagues as representative of the artists of Ireland. Our assurance of your Excellency's consideration and sympathy was not misplaced. It was evidenced by a friendly Commission of inquiry, directed by your Excellency, into the affairs of the Academy, undertaken by no less a distinguished servant of the Crown than Sir William de W. Abney, K.C.B. We take this opportunity to express our personal gratitude to your lordship, and our appreciation of the sympathetic spirit and painstaking patience with which Sir William brought his great administrative experience to bear upon the affairs of the Royal Hibernian Academy. His report not only dealt with the main issues vital to the existence of the Academy, with which we have to occupy your Excellency's attention to-day, but offered suggestions as to details of administration, to be recalled and considered by our members with respect, should it be their fortune at a future time to debate details of internal management in a reformed and prosperous Academy, under conditions which differ from the present ones. We have to thank your Excellency for raising the condition of the Hibernian Academy to the position of a public question. In that aspect we desire but to address ourselves on this occasion to the broader question of the relation of the Academy of Arts of Ireland as a State institution to the Government of the country. In England, in the sister kingdom of Scotland, and it may be said in every State in civilised Europe, it has been fully recognised for half a century back, that the nurture of art education is the duty of the State, and the agencies by which it is promoted are three. 1st. By State-aided system of primary and general art instruction in public schools and schools of art. 2nd. By establishment of art museums, under which comes primarily the institution of a national gallery of painting and sculpture, distinctly illustrative of past art of various schools, and being the works of deceased artists. 3rd. By the institution and grant of privileges by charter to a guild of artists, a national academy of arts, fulfilling the circle of art education, primarily by its public charges of maintaining exhibitions of living and contemporary art; and, secondarily, of encouragement of native artists and advanced art instruction to students adopting art as a profession, given by its artist members. Such is the acknowledged circle of art education in most countries, and which has successfully and harmoniously achieved a vast advance in the art culture of the British people in the last half century in England and Scotland. Each of the three divisions defined

is the complement of the others, and indispensable. Such, your Excellency, was the conception, as we know, of those who first designed a comprehensive scheme for a liberal establishment of art education and culture in Ireland about the year 1876. It was understood then that (as in the like establishment in Scotland in 1858) there would be given to the Royal Hibernian Academy, considered as the representative of the artists of Ireland, its due position in reference to the promotion and teaching of the fine arts. There was an assurance among the artists of Ireland that in the scheme was contemplated the rehabilitation and extension of usefulness of the National Academy of Arts, founded and somewhat endowed by a private citizen in 1823, but chartered and recognised in its relation to the State by a subsidy, however small, for more than fifty years preceding 1876 and up to the present date. It would be useless now to inquire through what influences, whether through narrow misunderstanding of the scope of national art education in some quarter, or mere vicissitude, the Academy was simply dropped out of its place in the whole scheme, or the time indefinitely postponed for its inclusion in the consolidation and grouping of the art institutions to be located near Leinster House. No reason or explanation has ever reached the President or members of the Academy, who awaited an assured place and were willing to accept new conditions in taking part in the art culture of the country. No such omission had been made in a like establishment of grouped art institutions in Scotland, where a principle had been emphatically laid down by the Lords of the Treasury in a final minute of February 25, 1858, the objects of which were stated as:—(1) "The giving to the Royal Scottish Academy, which must be considered as the representative of the artists of Scotland, its due position in reference to the promotion and teaching of the fine arts;" and (2) "The securing to the inhabitants of Edinburgh by annual exhibitions of modern art, and by the foundation of a national gallery opportunities, which cannot be over estimated, of rational amusement, mental cultivation and refinement of taste." We can assure your Excellency that the postponement in calling the Royal Hibernian Academy to its proper co-ordinate place of usefulness for twenty-five years has been a serious misfortune to the art progress of this country, however liberally and nobly and successfully, as the Academy must admit, the State provided in 1877 for primary and general art teaching and a museum of industrial art and national gallery of works of past masters, in itself an estimable benefit to the artists of Ireland. It is true that the Academy has not failed in these twenty-five years to fulfil its trust in providing annual exhibitions of living and contemporary art for the people of Dublin, nor has it been unsuccessful in nurturing some artists of a native school, but with straightened and wholly inadequate means, drawn from a slender and dwindling private endowment and a State subsidy of 300*l.* per annum, of which less than 50*l.* in any year has been applicable to its general maintenance.

It was with no discontent and no extravagant dream that the Royal Hibernian Academy should ever remotely approach the affluent state of the Royal Scottish Academy, that we informed your Excellency in a former statement that the latter institution, as shown by record of its financial establishment in 1858, enjoyed an endowment which might be estimated at an annual value of 2,285*l.* By official courtesy we are enabled to verify that statement as correct in respect to 1858, and to state authoritatively that in 1901 the annual value of its endowments is not less than 2,000*l.* per annum, and its capital pension fund has increased to 27,866*l.* We are well informed of its history, and of the fortunate concatenation of circumstances to which it owes its splendid and well-used endowments. We are informed of the history that the basis of its good fortune was a considerable sum of money somehow accruing and cumulative under the Scotch Treaty of Union. We know that a wealthy municipality of Edinburgh was able to make a munificent contribution. We know that the artists of Scotland themselves were able to be contributors by bringing into the scheme valuable pictures as a nucleus of a National Gallery, and it was not unreasonable that the Treasury, stimulated by such encouragements, should bring in 30,000*l.*, of which 15,000*l.* was particularly to be credited to the Academy. How well and wisely Scotch academicians have used their means for forty-eight years, and the noble school of Scottish art which they have nurtured, can but command unqualified admiration of Irish artists, unalloyed by any other feeling. Returning to the Royal Hibernian Academy, the fact which we have to recognise and disclose to your Excellency and the public is that we can but little longer fill even a limited sphere of usefulness with a yearly diminishing endowment, the net annual value of which has come to be no more than 116*l.* The claims which we have to advance to rehabilitate the Academy, and place it with the grouped institutions of Leinster House, are, as a financial consideration, of the most moderate character. They involve no great or immediate capital concession from H.M. Government. We now claim rather some assistance at a present juncture which some public departments

might lend, if authorised and willing, under practicable and economical conditions. The urgent wants of the Academy may be stated as follows:—(1) A site and new galleries for its exhibition of modern and contemporary art in the vicinity of Leinster House. Of the vital necessity to the Academy of such a change of location from Lower Abbey Street your Excellency is well informed by us and the concurrent testimony of Sir William Abney. The site required for such buildings would be an area but about 700 square yards. The buildings themselves, for the requirements of recurrent temporary exhibitions, are the least expensive of those in the whole circle of art institutions, consisting but of a series of apartments giving a sufficient wall space for hanging pictures, and top-lighted, without architectural pretension or expense. (2) A new charter—the Academy has recognised the impracticability of reforms in various details of its constitution and membership under obsolete and injudicious restrictions of its original charter of 1823 and subsequent one of 1864. It desires a reformed charter, as nearly as circumstances will permit assimilated to the charter of the Royal Scottish Academy. In its impecunious condition it cannot command the funds for the usual considerable fees payable to Crown departments for obtaining a charter, and the members would ask for your Excellency's influence in facilitating the free grant of such a charter essential to its reconstitution and vitality. (3) The Academy claims that the small fund realisable out of past private endowment should remain vested in it, giving a small margin of assured annual income absolutely essential to carrying on its work for the public benefit. It would desire to make what property it possesses in its library and prints, &c., more usefully enjoyed for public advantage than heretofore exclusively for members of the Academy. 4. It would further desire to maintain its autonomy and reasonable independence, under which alone, with many difficulties, its members disinterestedly have been able to discharge the Academy's duty to the Irish public for eighty years, and which constitute the essence of vitality of every academy of fine arts. In conclusion, we do not desire to be assumed to press for any immediate financial grant from His Majesty's Government at an inopportune time, but we do earnestly desire, in the period that remains of your Excellency's influence in Irish affairs, to secure, through your lordship's goodwill, an official recognition and record of acknowledged claims to State consideration in course of future time. With such hopeful assurance gained, it may be possible to prolong the existence of the Royal Hibernian Academy until, by gradual reform, it takes its practical and useful place in culture of art education in Ireland. It is desired that I should add that this statement, which your Excellency has been so considerate as to accept at the desire of the Royal Hibernian Academy through its President, is the entirely unanimous one of its members. It has been formulated with anxious consideration by repeated conferences of the whole body of members in full attendance and with absolute agreement. As such I was deputed to present it by unanimous vote at a special full general assembly held on November 7, 1901.

The Lord Lieutenant then replied to the deputation. He said:—Sir Thomas Drew and gentlemen, I am afraid that I shall not be able to make any promises or to give any details which can materially assist the object which you have so eloquently and so clearly brought under my notice. The object of a deputation such as this is generally twofold. In the first place it consists in affording an opportunity of making statements publicly, and making known publicly the views of those who represent their colleagues on those occasions, and in the second place it affords the member of the Government who receives it an opportunity of giving some hope of amendment, or of giving an adequate reply to the complaints which might be made. In this instance, as in many others, I must say that the first of these objects is one which, I think, will be most fully accomplished. I ought at once to say that I do not think it is possible for me to make any promises or give any pledges to the members of the Hibernian Academy here present as to any changes which may be brought about, or as to any further assistance which may be given to the Academy, especially in the absence of the responsible member of the Government, viz. the Right Hon. Horace Plunkett, who, I had hoped, would have been able to be present on this occasion. He, however, is absent. He has gone to America, and I have been unable to communicate with him, and we shall miss his presence here, but I shall take care that every word said, and that may be said here, will be brought to his attention. Gentlemen, I fully sympathise with the position in which the Hibernian Academy feels itself now, and has felt itself for some time past. I agree with what Sir Thos. Drew has said as to misapprehension of the objects of the Academy. These objects undoubtedly are not merely and simply for the sake of providing an exhibition of paintings annually, but they also include teaching, both in the art school and also in the examples and models which they afford, and we hope will afford, in future in your museums, in the assemblage to which

Sir Thomas Drew has alluded of pictures of artists of a gone day, which shall serve as examples to students as they come; but the great difficulty, as it always seemed to me under which you labour, probably the one most apparent, which appears most prominently to the Irish public, is inadequacy of the building in which your exhibition is held. I cannot gauge myself as to how far the inadequacy of the building has influenced or, rather, injured the condition of the art school of Ireland, but I am quite sure that the building is inadequate, and I am sure that the exhibition is not held in circumstances likely to facilitate your task or to be beneficial to the art welfare of this country. I therefore think your claim for something should be done to assist the removal of your exhibition-room, and that quarters should be given to the Hibernian Academy in the centre in which all the other scientific and artistic buildings have been, or are about to be erected, is a most reasonable one, and it is one which I should certainly press on my colleagues, and which I have every hope may be acceded to. Then the other requests which have been made in this paper I must say I can only characterise as extremely moderate and most reasonable. You ask also for a charter, which charter you very naturally wish should be granted free of cost. That does not appear to me in itself to be a request which can be characterised as in any way unreasonable. It is one that quite evidently would increase your powers of usefulness, and result in great benefit to your art, and it is one also which I should have very great pleasure in discussing with the Treasury and with those with whom the decision more immediately rests. There is a paragraph in the statement which has been read, the meaning of which I do not quite catch. It is that the Academy claims that the small fund realisable out of past private endowment should remain vested in it? Can you give me an idea of what is meant by that?

Sir Thomas Drew: Yes, your Excellency. It means that the only private endowment which the Academy has is an endowment in the shape of its old buildings in Abbey Street, an asset we value at 7,000*l.*, and we should be anxious to keep that capital when it becomes realised money, and that the small interest accruing from it should be constituted a small fund to meet the annual expenses. It has been one of our difficulties up to the present that we have had no margin whatever.

The Lord Lieutenant: Is not the property now vested in the Hibernian Academy?

Sir Thomas Drew: Oh yes, it is; but we took it into consideration as to whether the sale of the premises should be to the establishment of new premises, and there was an impression amongst many that that would not be reasonable, and that the private endowment of Francis Johnston should be retained by the Academy. It is a small amount of 7,000*l.* 8,000*l.*

The Lord Lieutenant: I shall see that that also is represented. The last request you make I see is for autonomy and for reasonable independence, under which alone, you say, with many difficulties, its members disinterestedly have been able to discharge the Academy's duty to the Irish public for eighty years, and which constitute the essence of vitality of every academy of fine arts. Am I to conclude from that that you believe that the administration wish to have a voice in and control over the department?

Sir Thomas Drew: We wish to run precisely on the lines of the Royal Scottish Academy and the Royal Academy in London. It is a matter of history that attempts were made to bring the Royal Academy of London under the control of the Treasury and of Parliament, and time after time that Academy resisted any claim of domination over it, and it successfully asserted its position. The Royal Scottish Academy were again and again concerned in negotiations over an attempt to make them subservient to some public department, and the Scotchmen resisted the attempt, and it is a matter of fact that the great vitality of both those academies is due to the utter independence of departmental control, an independence enjoyed by most great guilds.

The Lord Lieutenant: If the Royal Hibernian Academy changed their quarters and took up their abode near the other buildings, the museum buildings or science and art buildings, am I to understand that they would wish, although being contiguous to them, to be entirely independent of them?

Sir Thomas Drew: A difference has to be drawn between teaching and exhibiting colleges. I don't think it unreasonable that the teaching should be under departmental control.

The Lord Lieutenant: You don't object to that?

Sir Thomas Drew: No; it would be unreasonable to do so.

The Lord Lieutenant: I should also like to hear something more about the teaching. There is a school at the Academy and also a school of art and science. Is it the view of the Academy that the teaching of art at the Academy school should be set apart from all other art schools and departments?

Sir Thomas Drew: As to that, I think the view among the majority of artists is that the teaching of the Scottish Academy or the Hibernian Academy to those going for art is a profession is somewhat different to that given to pupils who

going for a primary art education. Our students, both male and female, who advance to maturity study from the nude figure, and free themselves from the rules of the primary school. The opinion is that this is the best plan, and in every centre in Europe it takes that form, and there is an advanced school for those who are going to study art as a profession. It has been stated and reported within the last few years that the Academy has not been doing good work in that direction. That is a very old story which has arisen from time to time, but we can assure your Excellency that never at any period in the history of the Academy have the schools been better attended than at the present both by male and female students. Although this is only a secondary purpose of the Academy we consider that we are exceedingly prosperous with regard to it.

The Lord Lieutenant: What is the average attendance?

Mr. S. Catterson Smith: Twenty altogether. Eight or ten has been the average attendance for some years.

The Lord Lieutenant: Has not the attendance increased of late years?

Mr. Catterson Smith: It has.

The Lord Lieutenant: From how many?

Mr. Catterson Smith: We have twenty altogether, but the average attendance is from eight to ten.

The Lord Lieutenant: How could you secure the attendance of more students?

Mr. Catterson Smith: We have had several applications from students during this session. The number is increasing considerably.

Sir Thomas Drew: The number mentioned—ten or twelve—appears large in proportion to the limited number of students going on for the profession of art in Ireland. That average presents a large attendance.

The Lord Lieutenant: I don't know, gentlemen, that I have anything further to add, except that I shall be glad if any gentleman present has anything to say in regard to any subject that may have been accidentally passed over. It is hardly necessary for me to say that I take a very sincere interest in the progress of your Academy, and I wish that the representation you give of your own position were more satisfactory, and such as to reasonably lead one to hope for greater success in the immediate future. If anything can be done in the direction you wish, I shall do all in my power to bring it about. I have myself felt, I am sorry to say, that the Academy does not occupy quite as influential a position as it should, and I am bound to say that I do not think the Irish public sufficiently appreciate the necessity of encouraging your art by attendance at the exhibitions and so forth; but I can only hope that with the change of quarters alluded to, and public attention having been called to the existing state of affairs, that the Academy shall receive support from those of the Irish public who take an interest in your profession and the aims it encourages. I don't think that I can say anything more, except to thank you gentlemen for coming here, and I hope that if there are any further suggestions or statements that you or your President have to make you will not fail to make them, and I will do all I can to meet your wishes.

The deputation then withdrew.

LORD KELVIN AND THE LATE P. Q. TAIT.

AT the last ordinary meeting of the Royal Society of Edinburgh, Lord Kelvin, the president, read an appreciation of the late Professor Tait. After referring to his early life he said:—In 1860 Tait was elected to succeed Forbes as Professor of Natural Philosophy in the University of Edinburgh. It was then that I became acquainted with him, and we quickly resolved to join in writing a book on natural philosophy, beginning with a purely geometrical preliminary chapter on kinematics, and going on thence instantly to dynamics, the science of force, as foundation of all that was to follow. I found him full of reverence for Andrews and Hamilton, and enthusiasm for science. Nothing else worth living for, he said; with heartfelt sincerity I believe, though his life belied the saying, as no one ever was more thorough in public duty or more devoted to family and friends. His two years as "don" of Peterhouse and six of professorial gravity in Belfast had not wholly polished down the rough gaiety nor dulled in the slightest degree the cheerful humour of his student days; and this was a large factor in the success of our alliance for heavy work, in which we persevered for eighteen years. "A merry heart goes half the day, a sad one tires in a mile o'." The making of the first part of "T and T" was treated as a perpetual joke, in respect to the irksome details of interchange of drafts for "copy," amendments in type and final corrections of proofs. It was lightened by interchange of visits between Greenhill Gardens, or Drummond Place, or George Square and Largs, or Arran, or the old or new College of Glasgow; but of necessity it was largely carried on by post. Even the postman laughed when he delivered one of

our missives, about the size of a postage stamp, out of a pocket-handkerchief in which he had tied it, to make sure of not dropping it on the way. One of Tait's humours was writing in black chalk on the bare plaster wall of his study in Greenhill Gardens a great table of living scientific worthies in order of merit. Hamilton, Faraday, Andrews, Stokes and Joule headed the column, if I remember right. Clerk Maxwell, then a rising star of the first magnitude in our eyes, was too young to appear on the list. About 1878 we got to the end of our "Division II." on "Abstract Dynamics;" and, according to our initial programme, should then have gone on to "properties of matter," "heat," "light," "electricity," "magnetism." Instead of this we agreed that for the future we could each work more conveniently and on more varied subjects without the constraint of joint effort to produce as much as we could of an all-comprehensive text-book of natural philosophy. Thus our book came to an end with only a foundation laid for our originally intended structure. Tait's first published work was undertaken in conjunction with a Peterhouse friend, Steele, who was his second in the University both as wrangler and Smith's prizeman. They commenced their work together immediately after taking their degrees; but Steele died before more than two or three chapters had been written, and Tait finished it alone and published it four years later under the title "Tait and Steele's Dynamics of a Particle" (1856). It has gone through many editions, and still holds its place as a text-book. Tait's second published book, "Elements of Quaternions," was commenced under the auspices of Hamilton; but in deference to his wish not published till 1867. It has gone through three editions, and is, I believe, the text-book for those who wish to learn the subject. Tait also produced several valuable treatises, short, readable, interesting and useful on various subjects in physical science:—"Sketch of Thermodynamics" (1867), "Recent Advances in Physical Science" (1876), "Properties of Matter" (1885), "Light" (1884), "Thermodynamics" (1888), "Dynamics" (1895). In the Royal Society of Edinburgh we all know something of how Tait has enriched its proceedings and transactions by his interesting and varied papers on mathematical and physical subjects from year to year since 1860, when he came to Edinburgh to succeed Forbes as Professor of Natural Philosophy in the University. Nearly all of these are now collected, along with a considerable number of other scientific papers which he brought out through other channels, arranged in order of time, from 1859 to 1898; one hundred and thirty-three articles in all, republished by the Cambridge University Press in two splendid quarto volumes of 500 pages each, a worthy memorial of a life of laborious whole-hearted devotion to science. The "Scientific Papers" collected in these two volumes abound in matter of permanent scientific interest, and literary interest, too, as witness the short articles on "Hamilton," "Macquorn Rankine," "Balfour Stewart," "Clerk Maxwell" and "The Teaching of Natural Philosophy." Of all the mathematical papers in the collection, the one which seems to me most fundamentally important is Part IV. of "Foundations of the Kinetic Theory of Gases," in which we find the first proof (and, I believe, the only proof hitherto given) of the theorem enunciated first by Waterston, and twelve years later independently by Clerk Maxwell, asserting equal average partition of energy between two sets of masses larger and smaller, taken as hard globes to represent the molecules of two different gases thoroughly mixed together. The collection contains also papers describing valuable experimental researches made by Tait through many years on various subjects—thermo-electricity, thermal conductivity of metals, impact and duration of impact, pressure errors of the *Challenger* thermometers, compressibility of water, glass and mercury (contributed originally to the "Physics and Chemistry" of H.M.S. *Challenger*). His work for the *Challenger* report was a splendid series of very difficult experimental researches carried on for about nine years (1879-88), with admirable scientific inventiveness, and no less admirable zeal and perseverance. One little scientific by-product of extreme interest I cannot refrain from quoting. Referring to a hermetically sealed glass tube under tests for strength to resist great water pressure:—"I enclosed the glass tube in a tube of stout brass, closed at the bottom only, but was surprised to find that it was crushed almost flat on the first trial (when the glass tube broke). This was evidently due to the fact that water is compressible, and therefore the relaxation of pressure (produced by the breaking of the glass tube) takes time to travel from the inside to the outside of the brass tube; so that for about one-tenth thousandth of a second that tube was exposed to a pressure of 4 or 5 tons weight per square inch on its outer surface and no pressure on the inner. The impulsive pressure on the bottom of the tube projected it upwards, so that it stuck in the tallow which fills the hollow of the steel plug. Even a piece of gun-barrel, which I substituted for the brass tube, was cracked, and an iron disc, tightly screwed into the bottom of it to close it, was blown in. I have since used a portion of a thicker gun-barrel, and have had the end welded in. But I feel sure that an impulsive pressure of 10 or 12 tons

weight would seriously damage even this. These remarks seem to be of interest on several grounds, for they not only explain the crushing of the open copper cases of those of the *Challenger* thermometers which gave way at the bottom of the sea, but they also give a hint explanatory of the very remarkable effects of dynamite and other explosives when fired in the open air. (It is easy to see that, *ceteris paribus*, the effects of this impulsive pressure will be greater in a large apparatus than in a small one.) The Keith Medal of the Royal Society of Edinburgh was awarded to Professor Tait in the year 1869, and again in 1874; and one of the royal medals of the Royal Society of London was awarded to him in the year 1886. The Gunning Victoria Jubilee prize of the Royal Society of Edinburgh was awarded to him in 1890. Enthusiast as he was in experimental and mathematical work, he never allowed this to interfere with his University teaching, to which, from beginning to end of the forty years of his Professorship, he devoted himself with ever fresh vigour and with unremitting faithfulness as his primary public duty. With not less devotion and faithfulness during all these years he has worked for the Royal Society, of which he was elected a Fellow when he came to Edinburgh as Professor. At the commencement of the following session he was elected a member of Council, and in 1864 he became one of the secretaries to the ordinary meetings. In 1879, in succession to Professor Balfour, he was elected to the general secretaryship, and he held this office till the end of his life. His loss will be felt in the Society not only as an active participator in its scientific work, but also as a wise counsellor and guide. It has been put on record that "The Council always felt that in his hands the affairs of the Society were safe, that nothing would be forgotten, and that everything that ought to be done would be brought before it at the right time and in the right way." In words that have already been used by the Council, I desire now to say on the part, not only of the Council, but of all who have known Tait personally, and of a largely wider circle of scientific men who know his works:—"We all feel that a great man has been removed, a man great in intellect and in the power of using it, and in clearness of vision and purity of purpose, and therefore great in his influence, always for good, on his fellow-men; we feel that we have lost a strong and true friend." After enjoying eighteen years' joint work with Tait on our book, twenty-three years without this tie have given me undiminished pleasure in all my intercourse with him. I cannot say that our meetings were never unruffled. We had keen differences (more frequent agreements) on every conceivable subject—quaternions, energy, the daily news, politics, "Quicquid agunt homines," &c. We never agreed to differ, always fought it out. But it was almost as great a pleasure to fight with Tait as to agree with him. His death is a loss to me which cannot, as long as I live, be replaced. The cheerful brightness which I found on our first acquaintance forty-one years ago remained fresh during all these years, till first clouded when news came of the death in battle of his son Freddie in South Africa, on the day of his return to duty after recovery from wounds received at Magersfontein. The cheerfulness never quite returned. The sad and final breakdown in health came after a few weeks of his University lectures in October and November of last year.

ROYAL ACADEMY SCHOOLS.

ON Tuesday evening Sir E. J. Poynter, president of the Royal Academy, announced the prizes obtained by the students in the recent competition, as follows:—

Historical Painting (Saul and the Witch of Endor—1. Samuel xxviii. 7-14).—Gold medal and travelling studentship (200*l.*), George Murray; *proxime accessit*, Fred Appleyard.

Landscape Painting (One of the Bridges over the Thames in London).—Turner Gold Medal and Scholarship (50*l.*), Osmond Pittman.

Landscape Painting (Cumulus Clouds over a Fen Country).—Creswick Prize (30*l.*), Osmond Pittman.

Painting of a figure from the life (open to male students only).—Silver medal—1st, Frank Samuel Eastman; 2nd, Jas. P. Sidney Streatfield.

Painting of a head from the life.—Silver medal—1st Gertrude Lindsay; 2nd, Frederick Dallas Barnes.

Painting of a draped figure (open to female students only).—Silver medal—1st, Lizzie Hands; 2nd, Annie Margaret Page.

Cartoon of a draped figure (A Mourner).—Silver medal and prize (25*l.*), Elsie Gregory.

Design in monochrome for a figure picture (The Sacrifice of Manoah—Judges xiii. 19-20).—Armitage Prizes—1st (30*l.*) and bronze medal, Ernest Board; 2nd (10*l.*), Alfred William Sangster.

Design for the decoration of a portion of a public building (The Maske of Cupid—Spenser's "Faërie Queene," Book iii. Canto 12, v. to xxvi.)—Prize (40*l.*), Frank Samuel Eastman; *proxime accessit*, William Ewart Gladstone Solomon.

Set of six drawings of a figure from the life (open to male students only).—1st prize (50*l.*) and silver medal, Walter Ernest Webster; 2nd (25*l.*), William George Simmonds; 3rd (15*l.*) Jas. P. Sidney Streatfield; 4th (10*l.*), Frederick George Swaish (Mr. Streatfield and Mr. Swaish were disqualified owing to having received a superior prize in the same competition before.)

Drawing of a head from the life.—Silver medal—1st, Walter Percy Day; 2nd, John Hodgson Lobley.

Drawing of a statue or group.—Silver medal—1st, John Hodgson Lobley; 2nd, Arthur Bentley Connor.

Perspective drawing in outline (open to painters and sculptors only).—(The Entrance-hall of the Royal Academy).—Silver medal, Ada Gladys Fuller.

Composition in sculpture (Boadicea urging the Britons to avenge her outraged daughters).—Gold medal and travelling studentship (200*l.*), Stanley Nicholson Babb.

Model of a design (The Expulsion of Adam and Eve from Paradise).—1st (30*l.*), Frederic Charles Chrisfield; 2nd (10*l.*), Frank Ransom.

Set of four models from the life (open to male students only).—1st (50*l.*) and silver medal, Alexander James Leslie; 2nd (20*l.*), Arthur Charles White.

Design for a medal (in commemoration of the Death of Queen Victoria, with a head of the Queen on the obverse).—Silver medal, George Gilbert Walker.

Model of a bust from the life (open to female students only).—No competition.

Model of a statue or group.—Silver medal—1st, Louis Richard Garbe; 2nd, Elsbeth C. P. Rommel.

Design in Architecture (a Town Hall for one of the new London Borough Councils).—Gold medal and travelling studentship (200*l.*), Bernard Hugh Webb.

Set of Architectural Drawings (The Trinity House).—Silver Medal—1st, Charles Thomas Palmer; 2nd, Percy Ion Elton.

Set of Architectural Designs (Upper School).—Prize (25*l.*), Francis Winton Newman.

Set of Drawings of an Architectural Design (Lower School).—Prize (10*l.*), Thomas Gerard Davidson.

Plan of a Building (A Casino and Pleasure Grounds on the borders of a Lake).—Prize (10*l.*), Lionel Upperton Grace.

Original Composition in Ornament.—No competition.

Perspective Drawing in outline (open to architects only) (Lord Burlington's Villa at Chiswick, published in Kent's book).—Silver Medal, Alfred Charles Bossom.

The Landseer Scholarships in Painting and Sculpture, of 40*l.* a year each, tenable for two years, have been awarded—in Painting, to Frank Samuel Eastman, Alfred William Sangster and Frederick Dallas Barnes (extra); in Sculpture, to Charles James Pibworth and Frank Ransom.

The President said that in his last address he endeavoured to impress upon them that, although original genius was a gift granted to very few, it was within the power of all who had the artistic faculty to arrive at excellence—even at eminence—in their art by study and the determination "to neglect nothing." It was to be observed that Leonardo da Vinci when he would judge of the disposition of a young man for painting said nothing about gifts or talents or original genius, but referred to a capacity for perseverance as affording the best test. Love for his work was truly the best equipment for an artist, far better than brilliant qualities, or what was called cleverness, a gift of no value in itself without the perseverance which would turn it to good account. Cleverness and technical facility were only useful as a means to an end; unless the result was worth attaining they served only as a display of vanity, the most contemptible use to which the artistic faculty could be put. The desire to be original was a constant besetment of the young artist, but unless founded on a solid base of knowledge and study it was apt to lead to mere eccentricity and to show a desire to astonish rather than to command that legitimate admiration which sensible people would give to all well-considered and thoughtful work; and there was perhaps nothing more distressing to the intelligent observer of a work of art than an evidence of the desire to be original at all costs and where there was neither genius nor knowledge to support it. Novelty, in fact, was not necessarily originality; and respect for tradition was a far better groundwork for a young artist than the cultivation of novelty of ideas or treatment, with the aim of showing his independence of tradition. Every artist, in so far as his individuality differed from that of every other, might be said to possess some degree of originality; it was only by assiduous study of nature, of course, under guidance, but more especially of the great works of past times, works which were stamped by the consensus of admiration of all thinking and studious minds, that it could be developed. Least of all could the artist be original by refusing to follow the traditions of the great masters. "Study nature assiduously," said Reynolds, "but always with those masters in your company," not, he meant, for an imitation of their manner, but for study of their methods of seeing and rendering nature. "Art for art's sake," to use a cant phrase of to-

ay, had no meaning for them. That was not to say that the artists of old time did not take an exquisite pleasure in their work; it was not to be supposed that Raphael or Rembrandt did not consider their art a sacred object on which to lavish their utmost powers to bring it to perfection, each according to his peculiar endowments; but that with them their art, consummate as it was, was always a means to an end, a vehicle for expression. With Raphael a divine sense of form clothed those ideas with a beauty inexpressible; with Rembrandt consummate mastery of technical skill was subordinate to a profound and poetic insight into the mysteries of nature and humanity; with neither was the display of the art which they had mastered an object in itself. He had made those few preliminary remarks, not because he thought that in the works which were exhibited in those rooms, and which were the result of their year's studies, there was to be noticed a prevalence of the faults against which he had been warning them, but because there could be no question that at the present time in the example set by many clever men, especially among the French, whose brilliant qualities were apt to lead too frequently to a desire for notoriety, there was a tendency to exalt technical skill and novelty of invention as in themselves an aim, and superior to the sober study of art as a means of expression. They were not their greatest men who did this, but the example was nevertheless dangerous and the tendency was catching. There was nothing more calculated to mislead the young artist than to be told that cleverness and originality were sufficient in themselves, that the methods of the great masters were "played out," and that to follow in their lines was academical and not worthy of the gifted genius. He had before combated the very prevalent idea that genius was dwarfed or fettered by the study of what was traditionally received as great; the idea was not new, and he did not know that he could say anything new upon it. What Reynolds had said was good for all time:—"The more extensive your acquaintance is with the works of those who have excelled, the more extensive will be your powers of invention, and what may appear still more paradoxical, the more original will be your conceptions." The highly false idea that it was necessary to discard the old in order to produce something new took different forms at different periods, and what was now called in cant phrase and bad English "modernity" or "the modern note" was held to be a distinguishing feature of the original genius. There was no need, however, to affect any such quality, it was sure to appear in whatever they did; the spirit of the time could not but impress itself on the art of the day in some form or other, and it would show itself in spite of all efforts to hide it. Moreover, he failed to see that to adopt the pattern of design or colour, or the startling methods of execution of some eccentric painter in vogue, showed one whit more originality in the imitator than to follow in the steps of the great men of the past. Such aping of eccentricity might be good for the comic journals, but for serious art never. It was often not originality that the artist was deficient in, but the power of bringing it out, and that power, as Reynolds had said, was only to be acquired by the study of nature in company with good examples. When by assiduous cultivation by those means they had mastered the power of expressing their ideas, they would be able to devote themselves to the composition and treatment of a subject. If, then, they thought of the most forcible and vivid way of expressing it in conformity with what was most probable under the conditions given; if they endeavoured to realise not only its external and pictorial aspect, but the spirit of the actors, what originality they had would find its way without their having to force it. Let them get at the heart of their theme, and they would find that they had been original without knowing it. After referring in some detail to the subjects of the more important competitions and to the work of the students in connection with them, the President said that he looked upon as unworthy of their imitation those productions of art which, in accordance with a prevalent fashion, depended on a display of technical skill and the rendering of "values," to use the phrase of the day, as the highest qualities which would occupy the painter. Those qualities were in themselves admirable, so admirable that no painter could do without them. They were the elementary necessities of his art, but there was nothing new in them. They were to be found in the works of all the great painters, but to make them the end and object of art was to invert the right order of things, to put the cart before the horse. It was indubitable that a brilliant display of technical powers had a great fascination, but if the artist had nothing better he should display it, as the Dutch painters did, in the rendering of still life, not degrade to it the loftier themes in which human action and human passion and human portraiture came into play. There were painters, no doubt, whose qualities in that respect made us often forget their faults. Franz Hals, with his daring, if vulgar, execution, was one; but if they were tempted to rival his brilliant diversity in brushwork they should remember that, like those great masters of the brush, Rembrandt, Vandyke, Velasquez,

he too began with a careful and dry method of study, and that his amazing skill was only developed by degrees. He desired to warn them against certain schools of painting which placed method before the higher demands of the art. It was not that among the exponents of those schools there were not many gifted men, but that their example was dangerous to follow. When we saw beauty, character, form, design, invention, poetry, story, expression—he might almost say, judging from some much-lauded examples to be seen on the walls of foreign exhibitions, humanity itself—ignored in a work of art, and certain qualities of mere method exalted; when the human form and face were made merely the vehicle for an exhibition of the artist's skill in the lower forms of the art, accompanied, as it often was, by an apparently voluntary degradation of all that was noble in man and nature, we felt ourselves at a loss for any expression which would classify such work in the domain of art. To say that it was clever or displayed talent was not to the point. Talent in itself was nothing; it was the result that sprang from the proper cultivation of it that was of value. Surely the business of the artist was to seek for what was noble in humanity, to discover its character and beauty, and to render them with whatever of poetry was in his own nature, and with workmanship as perfect as his studies and practice could make it. When an artist painted a sandbank against a sky, the special qualities of light and tone and colour, the sense of "values," in fact, were perhaps the only qualities we looked for; but when the human face and form were treated in the same way as a mere exercise for the painter's skill in tones, or worse, as a mere copying of the squalid characteristics of some casual model posing as a goddess, or even, as he had seen, the Saviour Himself, we rebelled at the ignominious use to which they were put. Character, beauty, form, colour, expression were what we desired first; the rest was to be used for arriving at these results. "These ought ye to have done, and not to have left the other undone."

WORCESTER ARCHÆOLOGICAL SOCIETY.

THE first winter meeting of this Society was held on Tuesday evening, at the Worcester Shire Hall. Earl Beauchamp presided, and the attendance included Lady Mary Lygon, Canon the Hon. H. Douglas, Canon and Mrs. Porter, &c.

A letter was received from Messrs. Longmans, Green & Co., stating that Mrs. Creighton was about to publish a volume of essays and letters of the late Bishop Creighton, and wished to know if the Society would permit her to include a paper on "The Italian Bishops of Worcester," which appeared in the report of the Society. On the motion of Earl Beauchamp, seconded by Canon Porter, it was agreed to grant the request.

The librarian (Mr. A. B. Pinckney) alluded to the books now being placed at the Shire Hall, and moved that their thanks be tendered to Mr. Willis Bund and the County Council for the way in which they had met the Society.

Canon Porter seconded, and Earl Beauchamp said it was appropriate that at their first meeting they should pass a vote of thanks to the County Council, and Mr. Willis Bund in particular, and the motion was carried.

Mr. Willis Bund said the County Council were only too glad to be of any use to the Society so long as they had space to place at the use of the members for the benefit of the county and the Society.

Earl Beauchamp then read a paper on "The Coronation Service of the Sovereigns of England," describing the ceremony in Westminster Abbey, and quoting many parts of the service.

At the close a vote of thanks to Earl Beauchamp was proposed by Mr. Willis Bund, seconded by the Rev. J. B. Wilson, and heartily carried.

ST. MARY, CHATHAM.

IN taking down the nave of the parish church of St. Mary, Chatham, for the purpose of rebuilding, some beautiful old Norman arches in the west wall have been brought to light. The work has been temporarily stopped in order that a special fund may be raised to preserve these and other remains of the old Norman church. The recovery of this monument of the past has excited much interest among archæologists, and one local antiquary has offered to contribute 200*l.* towards the extra cost which will be necessary if the Norman remains are utilised and preserved in the rebuilding scheme. From the resemblance of the work to portions of Rochester Cathedral, it is believed that it dates back to the years 1130-40, and evidence exists that the Norman church of which it formed part remained standing until the second half of the eighteenth century. Some blocks of tufa have also been exposed to view during the demolition, and these are believed to be remains of the original Saxon church.

ARCHITECTURAL CRAFTSMEN'S SOCIETY.

AT the Glasgow Technical College on Friday, 6th inst., a paper was read by Mr. C. Ernest Monro, vice-president, entitled "Hotel Planning and Construction." The question of site, aspect and prospect was discussed, and following this, the position on plan and general treating of the various public rooms effectively illustrated. Among these the coffee-room was important, and should possibly have bay windows, ceiling of good height—say 14 feet—the floor of parquetry, and musicians' gallery provided if desired; the lounge situated conveniently to coffee-room and designed in a sumptuous if not luxuriant manner. The drawing-room also should be ready of access from coffee-room and have good outlook. The lecturer recommended the use of double sashes to these rooms, as also to the reading and writing apartments, to insure the exclusion of outside sounds. The matter of prospect was also to be considered regarding the bedrooms, as good outlook is desirable to these. The various other rooms, including kitchen, servery and offices with the sanitary treatment necessary, were each in turn treated of, and the lecture was illustrated by means of plans of several of these buildings erected in Scotland.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE associate section of the above Association met on the 4th inst. in the rooms, 117 George Street, Mr. J. Stuart Syme in the chair. Mr. John Ednie read a paper on "The applied art of to-day and yesterday." The paper dealt with the Classic and with the new school of design and decoration, and strongly advocated the adoption of originality as against imitation. The suburban villa came in for strong condemnation, and a suggestion was made that a committee of competent artists should be empowered to act as censors to prevent the amenity of beautiful districts being ruined by the wholesale multiplication of such monstrosities. A discussion followed.

TESSERÆ.

Photography and Architecture.

PHOTOGRAPHY, which has already achieved wonders, can render many most essential services to architecture. Its delineations of buildings are incomparable, and must cause the ablest draughtsman to despair of emulating them. No amount of skill and diligence could possibly attain to such perfect similitude. This fidelity, quite apart from the beauty of the productions, is of inestimable value. Excellent as drawings may be for their pictorial merits, there is always more or less doubt of their truthfulness. The better the artist, the more is he apt to indulge in the *furberia dell' arte*—putting in captivating effects which are not to be seen in the original. Deception to a practised eye is frequently written upon the pretended portrait, as when, in order to enhance the majesty of a building, the staffage or figures are made so much too small that the edifice appears considerably larger than it is. Falsehood is falsehood, however stated or expressed, and what good end is answered by this particular species of it we are unable to perceive, while it has the obvious disadvantage of causing disappointment when the original comes to be seen in its actual dimensions.

Stained Glass.

Ancient painted glass may be divided into three epochs corresponding with the three styles of Pointed architecture, save that the first also includes the days of Romanesque. The first style is remarkable for its profusion of bright and strongly-contrasted colours, arranged in arabesque patterns, the historical groups and single figures being mostly confined to small medallions of various forms. We need not say how barbarous the drawing of the glass of this age is. The finest specimens which England can afford are found in Canterbury Cathedral. In the middle period the use of single figures of larger size and of architectural canopies first came into vogue, and the wearisomely gorgeous grounds of the former period were replaced by transparent glass of a most delicate green tint, relieved by diapered patterns drawn with single lines. Beautiful glass of this period is found in the side windows of Merton College chapel, Tewkesbury Abbey Church, Wells Cathedral, SS. Peter and Paul, Dorchester, and (of late date) Bristol Cathedral. The third style of glass, by gradual declensions from the middle type, at length assumed the form of large pictures, or even landscapes, where subjects, nay single figures, were expanded with an utter contempt of the monials and to the great detriment of architectural effect. This style has never really been extinct. The Dutch glass painters of the seventeenth century propagated it with great activity, among whom we may mention the Van Lings, of whose works there are so many specimens at Oxford; and those monstrosities, the west window of New College chapel, the library

window of Trinity College, Cambridge, and the east window of Salisbury Cathedral may be referred to it.

The Gothic Principle.

The outline of Gothic in its widest sense is confessedly pyramidal. It is a tapering off, an extenuating of a substantial mass into nothingness; and it has been demonstrated in the case of several buildings that a triangle drawn from the ground to the highest point would actually include the entire edifice by its prominent points falling in accurately with the lines of the sides. In this respect Gothic is, of course, entirely different from the grovelling parallelogramic form of Grecian temples, which present the same extended horizontal outline against the sky that they exhibit on first starting out of the earth. They lose nothing in breadth by being "tossed up" to a height like the Gothic spire and sloping roof. But this pyramidal form is not gained by abrupt steps and horizontal stages, like the Elizabethan or debased Gothic and embattled gables. The diminution is gradual, by sloping ascents, by imperceptible fallings away; and it follows that in every point of declension from the wide to the narrow which the vertical wall receives, the outline presented to the eye is such as has been described. In chamfers and splays the same line will be found to be the external angle formed by the base of a right-angled triangle. The removal of any square edge will show this, which is the principle upon which the planes of mouldings in their most perfect development were mostly arranged.

The Phœnicians in Spain.

The first benefactors of the Peninsula were the Phœnicians, those English of antiquity, who wafted everywhere on the white wings of their merchant fleets the blessings of commerce and civilisation. Emphatically "workers in timber," the primitive meaning of an architect, they constructed the ships and ceilings of the wisest of kings, and all Europe to this day cannot compete with the gorgeous wood-carvings of Moro-Hispano art. The Phœnicians were welcomed by the natives of Tarshish—the south of Spain; men of peace not war, they settled on the coasts, and reared quays, factories and temples. They were, however, ousted by the Carthaginians, who, when deprived of Sicily by the arms of Rome, turned exclusively to the Peninsula, and, urged by a fierce spirit of conquest, penetrated into the interior, where they erected cities, citadels, arsenals and palaces, on which the simple Romans gazed with awe. All this strength and beauty has passed away like the fabric of a vision, scarcely a wreck has been left behind, save some colossal masonry at Tarragona, which still perplexes antiquarians. The very ruins of this remote period have disappeared, to which the sites at least of those hill forts that caught the military eye of Cæsar must be referred. But indeed some such castles are still perched on the eminences which guard the gorges and frontiers of southern Spain; they are decidedly Oriental in position, design and construction, being built with a concrete rubble *tapia*, a sort of cob, which, originating doubtless with the children of Tyre, has been continued down to the present time on both sides of the straits of Gibraltar, and without any change.

Cyclopean Work in Mexico.

There are numerous rock-hewn monuments scattered throughout Central America which the natives call Granaries of the Giants, but which in every respect resemble the cyclopean fabric near Argos, in Greece, called the Treasury of Atreus. The form of these structures is generally dome-shaped: a gallery leads to a central room, which is lighted by a cavity from the dome. In some cases the doorway to this gallery resembles in its cyclopean structure the Gate of Mycenæ; but there are some singular exceptions in which a knowledge of the arch and of the keystone (and the same thing has been proved by Rossellini and Belzoni to have existed anciently in Egypt) is clearly assignable to these architectural barbarians. Again, sepulchres have been found constructed on the very same model as those of Cyprus and Asia Minor, which probably preceded, but were at all events contemporary with, the most ancient monuments of Egypt. They are generally in the form of the Egyptian cross. A sloping passage, intended to be closed, leads to a vestibule, supported by a single column and ornamented with the matwork scroll, out of which branch sepulchral chambers to the right and left. In the "Antiquités Mexicaines" rock-built fortifications are exhibited which precisely resemble similar cyclopean structures at Tiryns and Perugia. The walls of their cities and fortresses are built of rough stones irregularly fitted into each other, and arranged in irregular courses precisely as all the walls of known cyclopean origin discovered in Greece and Italy are constructed. There is another and still more remarkable instance of the architectural identity which we are endeavouring to demonstrate. Some of their palaces, but more especially the combined temple, palace and city of Palenque, are characterised by the well-known cyclopean arch, consisting of receding steps of stone in a triangular form. At Palenque a rectangular square

is surrounded by cloisters built in this manner, being lighted by windows bearing the exact form of the Egyptian tau.

Expression in Architecture.

Every kind of construction, when carried out in the simplest manner, is productive of some peculiar expression, which may or may not be one and the same with the truth of construction. Thus, the literal fact of the balance of supporting and supported members is the natural expression of the unadorned Greek "hut," and this expression, heightened immeasurably in emphasis, is the fundamental expression of the Erechtheion and the Parthenon. Again, the semblance of ascendant energy, which is a violent contradiction of the literal truth of stones and mortar, is the unassisted expression of the nave walls, rising out of the aisle roofs, in the barest of the "temporary churches" on the outskirts of London. This expression was seized on by the inventors of the Northern Pointed, and was repeated and heightened and illustrated by them in a hundred different ways. The Lombard architects, who built according to the same leading form, which was that of the Roman basilica, wanted the groined roof, the pointed arch and the buttress system, and were consequently greatly limited in the power of developing its chief fundamental expression; they therefore devoted themselves, like the early Greek architects, to emphasising, by various appeals to the imagination, the simple constructive truth. Walls of enormous and uniform thickness were required to support the arched roof, and, accordingly, the strength of the wall is the theme of a most interesting and elaborate system of decoration. The Romans made an attempt to develop a system of expression out of a construction based upon the semicircular arch; they almost wholly failed. The attempt was renewed by the Byzantines, with little better success. It was reserved for the Arabian architects to found upon the mechanical properties of the arch an expression which emulated and even surpassed the Northern Gothic in the extent of its departure from obvious constructive reality. The Egyptian builder continually laboured to give expression to that preponderance of mass, the existence of which was a condition imposed upon him by his materials and his want of science in using them. The architecture of the Renaissance, in its best monuments, confuses rather than reconciles the three principles of the wall, the arch and the entablature. Other styles are modifications, combinations, or degradations of these, and respectively owe their claims to be regarded as styles to their development of one or more of these orders of natural expression.

The Original Ordnance Survey.

A general survey of the British Islands, under the direction of the Master-General of the Ordnance, was begun in 1791, and has been continued to the present time. The first conductors of this national undertaking were Colonel Williams and Captain (afterwards General) Mudge, of the Royal Engineers, and Mr. Dalby, who had previously assisted General Roy. They began their operations by remeasuring General Roy's base on Hounslow Heath with two steel chains of 100 feet in length, which had been very carefully prepared by Ramsden. The result was stated to differ from General Roy's only by $2\frac{1}{2}$ inches, but it has been remarked ("Ency. Brit.," art. "Trigonometrical Survey") that the two results were given in terms of different scales, and that, when reduced to the same standard, the real difference was 1 foot, at least, if reliance is placed on the comparison of the standards by Captain Kater. For the measure of the angles a new theodolite by Ramsden, of 3 feet in diameter (originally intended for the East India Company), was purchased by the Board of Ordnance. No general plan of operation appears to have been followed with respect to the triangulation, which was first carried along the southern coast westward for the purpose of determining the geographical positions of the principal headlands and harbours, and has gradually been extended over the whole kingdom. Four other bases, besides that on Hounslow Heath, were measured in England, namely, on Salisbury Plain, King's Sedgmoor, in Somersetshire; Misterton Carr, in Lincolnshire; and Rhuddlan Marsh, near St. Asaph. For the determination of the geographical positions the direction of the meridian was determined at five intermediate places between Dover and Land's End, namely, Beachy Head, in Sussex; Dunnose, in the Isle of Wight; Black Down, in Dorsetshire; and St. Agnes's Beacon, in Cornwall. In 1801 and 1802 the arc of the meridian extending from Dunnose to Clifton, in Yorkshire, was determined by Mudge. The two places were connected by a chain of twenty-two triangles, by which the terrestrial distance was computed from the bases on Hounslow Heath and Misterton Carr, and their astronomical latitudes were determined by a zenith sector by Ramsden, carrying an 8-foot telescope. The latitude was likewise observed at Arbury Hill, near the middle of the arc. By means of this intermediate observation and the intersections of the arc by the parallels of the Greenwich Observatory and

the Duke of Marlborough's Observatory at Blenheim the whole was divided into four partial arcs. In 1806 the meridian was extended to Burleigh Moor, in Yorkshire, rather more than a degree to the north of Clifton. With the view of fixing a scale of longitudes for the great map of England, an arc of a parallel circle was determined by means of reciprocal observations of azimuth at Dunnose and Beachy Head and the geodetical distance concluded from the triangulation. The result gave the length of a degree of longitude on the parallel of Dunnose, namely, $50^{\circ} 37' 7''$, equal to 232,914 feet, which is longer by about 748 feet than the degree on the spheroid deduced from the best determined arcs of meridian. But this method of determining the difference of longitude is liable to some uncertainty, as the result is considerably affected by small errors in the determination of the azimuths. It is now known that all the longitudes on the southern coast given in the Survey are erroneous to the extent of several seconds.

Canopies in Monumental Brasses.

The introduction of a canopy appears to have been coeval with that of the brass itself, and indeed we might naturally expect it to be so if we consider this kind of monument to have arisen from the effigy sculptured in relief, to which it was preferred, either from the greater convenience of its form, or from the want of stone suitable for carving figures. The latter supposition may perhaps account for the prevalence of brasses in the eastern counties. Of the earliest canopies scarcely any have remained to the present time, but the matrices from which they have been taken may give us some information of their character, and should never be passed by without inspection. They were frequently pyramidal in form, with crockets, finial and pinnacles, and supported by slender shafts. A beautiful example of this kind formerly surmounted the brass of a cross-legged knight in St. Andrew's, Gorleston, Suffolk. It was about the date of 1320. A little later we find a foliated arch introduced below the pediment, and the spandrel filled with a trefoil, as was originally to be seen at Holy Trinity, Bottisham, Cambridgeshire; the finest remaining example of this description occurs at Elsing, Norfolk, in the once rich and magnificent brass of Sir Hugh Hastings; here the place of shafts is supplied by niches filled with armed figures, and the spandrel contains a foliated circle, with a knight on horseback in the centre. From this time the ogee, more or less curved, became the common form of the canopy; the arch was filled with a row of small four-leaved flowers, and supported by half-shafts with capital and bases, and to these were added buttresses, surmounted by crocketed pinnacles. A peculiarity deserving of notice, which sometimes occurs in canopies of this century, and chiefly in those dating from 1330 to 1360, is the termination of the cusps by foliage in the shape of a trefoil; an instance of this may be seen in the brass of a priest at All Saints, Fulbourn, Cambridgeshire (circa 1360); and it is interesting to observe these ornaments repeated in the curious sedilia of the same church. The magnificent and well-known Flemish brasses of this period exhibit peculiarities of their own which it is not necessary to mention here. At the close of this century, and indeed throughout the next, the variety in the canopies was endless, and may be better understood from experience than from description; figures of saints are found in separate niches in all parts and sometimes supported on the finials, as in the splendid brass of Prior Nelond; sometimes, though but rarely, the soul of the deceased is represented as carried by angels into Abraham's bosom, as at Holy Trinity, Balsham, Cambridgeshire; and there are instances of other religious subjects in similar places, such as the Holy Trinity, the Annunciation, the Nativity and the Resurrection. Of this kind the cathedral of Old St. Paul's, which was rich in sepulchral memorials, contained some very fine examples. Single or triple canopies are sometimes enclosed in another of a circular form; the central circles are often filled with heraldic badges or short legends, and the figure supported by a basement ornamented with tracery, &c. A gradual change seems to have taken place at the commencement of the fifteenth century; the numerous spandrels are filled with more elaborate tracery, each member of which frequently contains foliage of three, four or five leaves, a peculiarity almost always to be found in canopies dating from 1410 to 1430. A beautiful example occurs in the brass of Judge Londyngton, at St. Peter, Gunby, Lincolnshire (1419), and another at St. Mary's, Great Shelford, Cambridgeshire (1411). This distinguishing feature may be found worth remembering, as it is readily known with a little practice, and usually decides the brass to be of this date. From about 1460 we may perceive a debasement in the design of the canopies, though they are still very beautiful and frequently rich and elaborate; more regard was now paid to perspective, groining was more generally used than it had hitherto been, the crockets were less simple and graceful, and the finials often of a clumsy form. This may be well illustrated by comparing the brass of the Duchess of Gloucester (1399) with that of Abbat Esteney (1498), both in Westminster Abbey.

In the sixteenth century the canopies appear to have fallen into disuse; those which remain to us of this period are comparatively heavy in design and coarse in execution; for as the architecture of the time was itself much debased it could not be expected that the architectural enrichments of brasses and stained glass would be exempted from the same fate. Probably one of the latest examples of this canopy was that of Bishop Goodrich in Ely Cathedral (1554). Of this, however, the figure and part of the legend are all that remain.

Paintings in Churches.

There is no aid more capable of creating religious sentiment or calculated better to convey such, or any other, information than a proper application of coloured and pictured representation. Such were the horn-books of religious instruction among our forefathers. Durandus calls pictures "the lessons, or scriptures, of the laity, or laic or unlearned, as distinguished from the cleric of his time;" and St. Gregory, with acute wisdom, remarks that "paintings appear to move the mind more than descriptions; for deeds are placed before the eyes in paintings, and so appear to be actually carrying on. But in description the deed is done as it were by hearsay, which affecteth the mind less when recalled to memory." And again on the same point—"what writing supplieth to him which can read, that doth a picture supply to him which is unlearned, speaking to the mind through the sense of sight." This principle is almost universally admitted and applied in other places; national galleries and museums are opened to foster a taste for and inculcate a knowledge among the million, to use a prevalent modern phrase, of worldly history and the wonders of nature and art. Why should not the walls of our churches be devoted to the teaching by similar means of heavenly things? Thousands would look upon a picture here displayed who, if in respect to capability were competent, would be careless to read, or if they did would imbibe less readily the sacred events recorded in a less direct or enticing medium. The mistaken zeal of Puritanism never did worse for religion than by so indiscriminately whitewashing our churches, while, artistically considered, the blow they gave has been a grievous and "a great discouragement" even to the present day; leaving our churches for the most part little better, and far less cared for as respects proper adornment and exposition of their purpose than almost our meanest rooms.

GENERAL.

The King has approved a site in Windsor Castle precincts for the erection of a statue of Prince Christian Victor, who died and is buried in South Africa. The cost of the statue, which will be executed by Mr. Onslow Ford, R.A., and placed in a canopied niche, will be 1,200*l*.

The Prince of Wales has purchased from Mr. Charles Sainton's exhibition the new silver point drawing *Puck Contemplative*, which has been on view for a few days at the Continental Gallery in Bond Street.

M. Loubet was expected to be present at the ball of the Société Centrale of French Architects in the Hôtel Continental on the 5th inst. He was, however, unable to attend, but he sent instead the sum of 500 francs to the treasurer.

The Late Mr. James Brooks, architect, has left property which is valued at 5,771*l*. 7*s*.

The Egyptian Government invite tenders, which will be received up to January 3, for the supply and erection of a lift bridge at the Razah Behera head of the Nile barrage.

Mr. Patrick Duncan, M.I.C.E., who has died in Persia, served for twenty-seven years in the Indian Public Works Department, mostly in connection with State railways. He became an executive engineer in 1883, and was employed on the Madura-Pamban railway survey in 1894. He retired from the service in October 1900.

A Petition signed by Birmingham medallists and others asking that the stamping should be enforced of the country of origin of each coronation medal has been submitted to the King. By His Majesty's command the document has been referred to the Board of Trade for consideration.

The Portsmouth Corporation have resolved that a sub-committee should make arrangements with the Local Government Board for a meeting in London to discuss various amendments in the borough by-laws as laid down by that body.

The Cuckfield Rural Council have adopted plans and specifications for two blocks of three houses each, at Lindfield, for the Council's workmen.

Boilly's Painting, the *Reunion of Artists in the Atelier of Isabeau*, has been bequeathed to the Louvre.

The Statue of Alphonse Daudet, the novelist, which is to be erected in the Champs-Élysées, Paris, at the desire of his widow, will not be unveiled until next spring. The statue is the work of M. de Saint-Marceaux.

The Building in Chancery Lane of the Incorporated Law Society is to be enlarged at a cost of 45,000*l*.

The Camberwell Public Baths competition has resulted as follows:—First premium, No. 18 (Mr. Harding Payne); second premium, No. 7 (Messrs. S. B. Russell and C. E. Mallows); third premium, No. 32 (Mr. Dighton Pearson). There were fifty-two designs, and Mr. A. Saxon Snell acted as assessor. Mr. Harding Payne has been appointed architect to the building, which is estimated to cost 50,000*l*. The whole of the designs will be on exhibition at the Camberwell Public Baths, Church Street, Camberwell Green, S.E., up to and including Wednesday next.

The London County Council have granted the Westminster Council a loan of 24,000*l*. for alterations, &c., to the town hall. The loan is to be repayable in three years, out of the proceeds of any sale of disused vestry halls or other recoupments.

The Meeting of the Institute of Architects fixed for Monday, December 16, will not be held, as Mr. Arthur Evans has, for reasons of health, been obliged to postpone his paper on "The Palace of Knossos in Crete."

The Ancient Church of St. Cecilia, in the Trastevere of Rome, has been reopened for service. It was closed for three years to allow of restoration, which is being carried out partly at the expense of the Italian Government and partly at Cardinal Rampolla's. Several interesting archaeological finds were made.

The Garden City Association have passed the following resolution:—"That the housing problem can be solved and the congestion in crowded centres relieved by a concerted movement of manufacturers, co-operators and others to new areas, arrangements being made for securing to the migrating people the whole of the increased value which their presence will give to the sites, and the areas being carefully planned so as to make adequate provision for the individual and social needs of the people, especially with a view to securing for all time the combined advantages of town and country life."

A Sketch of the *Ludus pro Patria* by the late Puvis de Chavannes, which was reproduced in *The Architect* a few years ago, has been sold in Paris for 40,000 francs.

The Archbishop of Canterbury consecrated on Friday the district church of St. Augustine of Canterbury at Margate. The church, erected from the designs of Mr. Dalby Reeve at a present cost of 5,000*l*., is of brick with Bath stone facings, and consists of nave and aisles, to which it is intended to add an apsidal chancel at a further cost of 2,000*l*.

The Site for the Federal capital of Australia has yet to be determined. So many have been proposed by various authorities, the commissioners are embarrassed in finding time to examine them. One of the principal difficulties is a water-supply that can be relied on.

The Westminster City Council having considered a recommendation by the improvements committee, that the London County Council be informed that the City Council approved the amended scheme for the widening of Piccadilly from Hyde Park Corner to a point opposite or a little to the east of Down Street, and that they would undertake the maintenance of the footway and carriageway of the widened thoroughfare on the completion of the works, have referred the recommendation back to the committee.

M. Roty has prepared a medal which is to serve as a memorial of the centenary of the foundation of the Bank of France.

The Hall of St. Winifred's Unsectarian Mission, at Rotherhithe, has been redecorated by the Kyrle Society. The paintings are the work of Mr. Audley Mackworth, who has presented them to the mission. The central picture, which measures 9 feet by 7 feet, represents the *Mayflower* carrying the Pilgrim Fathers to New England.

The Khedive inspected the great dam at Assuan on Monday, the works being explained by Mr. Webb, director-general of reservoirs. There were also present Sir Benjamin Baker, consulting engineer to the Egyptian Government, and Mr. Fitzmaurice, chief engineer, while the contractors were represented by Sir John Aird and Mr. Blue. The Khedive has conferred the second class of the Order of the Medjidieh upon Mr. Fitzmaurice, who is now on his way to England to take up the duties of engineer to the London County Council.

The Brighton Town Council have approved a clause for inserting in contracts for public works prohibiting contractors working on Sundays, pursuant to the resolution of the Council of November 9 last, viz.:—"The contracts shall not cause or permit the execution on any Sunday of any work in connection with the contract, except in special cases where the execution of such work is necessitated owing to accident or other circumstances rendering delay dangerous, or in cases in which the Corporation or their engineer shall think such work absolutely necessary, in which cases the execution of Sunday work shall be permitted to such extent only as shall be necessary for the purpose of temporarily remedying any defect in the work, or of making good or preventing damage, or as shall be sanctioned by the Corporation or their engineer."

THE

Architect and Contract Reporter**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

IMPORTANT NOTICE.

Owing to the Christmas Holidays, all Advertisements, Tenders, &c., for the issue of December 27, must reach the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 p.m., on Tuesday, December 24.

COMPETITIONS OPEN.

AUSTRALIA.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

BURSLER.—Dec. 20.—Competitive plans are invited for an isolation hospital. Premiums of 100*l.* and 50*l.* will be awarded to the designs placed first and second respectively. Mr. Arthur Ellis, town clerk, Burslem.

GLASGOW.—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes

upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

HULL.—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

IRELAND.—Jan. 20.—Plans, &c., are invited for drainage of Howth and Sutton, Dublin (and an alternative system for the latter). A premium of 50*l.* is offered. Mr. John O'Neill, clerk, board-room, North Brunswick Street, Dublin.

ISLE OF WIGHT.—Jan. 31.—Designs are invited for a suitable monument as a memorial to Her late Majesty, to be erected in St. James's Square, Newport, Isle of Wight. A premium of 25*l.* is offered for the accepted design. The Secretary, Isle of Wight Queen Victoria Memorial Committee, 20 Holyrood Street, Newport, Isle of Wight.

KENT.—Jan. 1.—Competitive designs are invited for laying-out about 16 acres of land, near Canterbury Road, Gillingham, as a recreation-ground. Premiums are offered of £20, £10 and £5. Mr. F. C. Boucher, clerk, Gardiner Street, New Brompton, Kent.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

SCOTLAND.—Jan. 15.—The Kirkcaldy Burgh School Board invite competitive plans for a technical and science and art school to accommodate from 400 to 500 pupils, and an elementary school to accommodate about 400 pupils. Mr. Alexander Beveridge, clerk to the Board.

CONTRACTS OPEN.

AXBRIDGE.—Dec. 19.—For laying about 9½ miles of cast-iron socket water-pipes, Axbridge, Somerset. Mr. A. Powell, engineer, 3 Unity Street, College Green, Bristol.

BAKEWELL.—Jan. 3.—For construction of a circular water-tight concrete reservoir to hold about 115,000 gallons, in the parish of Hassop, and the construction of a circular covered water-tight concrete service tank to hold about 50,000 gallons at the Headstones Head, in the parish of Ashford, and other works in connection with the proposed water-supply. Messrs. Sterling & Swann, engineers, Town Hall, Chapel-en-le-Frith.

BILSTON.—Dec. 20.—For supply of electric plant to the substation at Bilston, Staffordshire. Mr. G. Sales, secretary Midland Electric Corporation, Pearl Assurance Buildings, St. John's Lane, Liverpool.

BIRMINGHAM.—Dec. 30.—For erection of pavilions, boiler-house and other works at the workhouse, Erdington. Messrs. C. Whitwell & Son, architects, Temple Row, Birmingham.

BISHOP AUCKLAND.—Dec. 19.—For erection of a branch store, with butchery department, slaughter-house and stables, at Coundon. Mr. F. H. Livesay, architect, 107 Newgate Street, Bishop Auckland.

BLACKBURN.—For extensions to Norfolk Street (C.E.) schools, Mill Hill. Messrs. Stones & Stones, architects, 10 Richmond Terrace, Blackburn.

BLYTH.—For erection of large steam drying shed, for the Blyth Brick Company, Ltd, Links Road Works, Blyth,

SPECIALTY.**ERECTION OF ROUND FACTORY CHIMNEY-STACKS**

ON THE

"CUSTODIS SYSTEM,"

With Specially Constructed Patent Blocks.

Imphons Custodis Chimney Construction Co., SHEFFIELD.

Northumberland. Plans and specifications can be seen at the works.

BRISTOL.—Dec. 16.—For enlargement of the Easton school. Mr. J. Mackay, architect, Kingswood, Bristol.

BROMLEY.—Dec. 17.—For construction of strong rooms. Mr. F. H. Norman, clerk, District Council Offices, Bromley, Kent.

BROMSGROVE.—Jan. 8.—For sinking or boring to obtain a water supply for the new Barnsley Hall asylum. Mr. George T. Hine, architect, Westminster.

BURGESS HILL.—For taking-up of the present floors and relaying with wood-block flooring at the London Road boys' school. Mr. C. Botham, architect, 128 Queen's Road, Brighton.

BURY.—Dec. 17.—For construction of sewage-disposal works, comprising circular precipitation tanks, bacteria beds, channels, sludge tank and roads at Livsey Fields. Mr. John Haslam, town clerk, Corporation Offices, Bury.

CARDIFF.—Dec. 14.—For supply, delivery and laying of electric cables. Mr. Arthur Ellis, The Hayes, Cardiff.

CHATTERIS.—Dec. 23.—For erection of a Board school at Chatteris, Cambs. Mr. John Edwin Seward, clerk to School Board, Chatteris.

CHELMSFORD.—Dec. 18.—For construction of a filter at the waterworks in Mildmay Road. Mr. Thos. Dixon, town clerk, 16 London Road, Chelmsford.

COVENTRY.—Dec. 18.—For alterations and additions to Spon Street school. Messrs. George & Isaac Steane, 22 Little Park Street, Coventry.

DEWSBURY.—Dec. 31.—For erection of a covered market in Crackenedge Lane. Mr. G. Trevelyan Lee, town clerk, Town Hall, Dewsbury.

DINNINGTON.—For erection of seventeen cottages at Dinnington colliery, Northumberland. The Seaton Burn Coal Co., Ltd., A, Exchange Buildings, Newcastle.

DULVERTON.—Dec. 27.—For erection of a court-house and police-station at Dulverton, Somerset. Mr. William John Willcox, county surveyor, 1 Belmont, Bath.

DURHAM.—Dec. 19.—For providing and laying a 2-inch water-main from the Newbottle Board school to dwelling-houses known as Grasswell Terrace, adjoining the road from Houghton-le-Spring to Newbottle. Mr. William Morley, surveyor, Houghton-le-Spring.

EDINBURGH.—Dec. 30.—For erection of a steel latticed girder footbridge and trussed roofs in connection with the Edinburgh and Leith works at Granton. Mr. W. R. Herring, chief engineer and manager, New Street Works, Edinburgh.

FLEETWOOD.—Dec. 17.—For erection of Board schools, Chaucer Road, Fleetwood. Mr. T. G. Lumb, architect, 26 Birley Street, Blackpool.

GOSBERTON.—Dec. 17.—For enlargement of the infant classroom. Mr. R. H. Holmes Hand, 6 Double Street, Spalding, Lincs.

GRASSINGTON.—Dec. 17.—For erection of two cottages at Hebden, near Grassington, Yorks. Mr. James Hartley, architect, Skipton.

GRAVESEND.—Dec. 19.—For alterations and additions to sanatorium. Mr. C. E. Hatten, town clerk, Court House.

GREAT STANMORE.—Dec. 18.—For erection of an isolation hospital in Honey Pot Lane, Great Stanmore, Middlesex. Mr. James A. Webb, surveyor, Great Stanmore.

GREAT YARMOUTH.—Dec. 17.—For erection of a restaurant, Marine Parade. Mr. C. G. Baker, architect, Town Hall Chambers, Great Yarmouth.

HALIFAX.—Dec. 16.—For erection of an engine-house and other alterations and additions to Wellington mills, Halifax. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HALIFAX.—Dec. 18.—For erection of a villa residence, &c., on the Upper Greenroyd estate, Skircoat. Mr. W. Clement Williams, architect, 22 Southgate, Halifax.

HAMMERSMITH.—Dec. 18.—For constructing a river wall and an elevated track for crane, and other works in connection therewith at the wharf, Chancellor's Road. Mr. H. Main, borough surveyor, Town Hall, Broadway, Hammersmith.

HAMPSTEAD.—Dec. 19.—For installation of an electric fire-alarm system at the North-Western Fever Hospital, Lawr Road, Hampstead, N.W. Mr. T. Duncombe Mann, clerk, Metropolitan Asylums Board, Embankment.

HARROGATE.—Dec. 23.—For erection of a house and stable. Messrs. Adkin & Hill, architects, 10, 11 and 12 Prudential Buildings, Bradford.

HASTINGS.—Dec. 17.—For construction of a lift station and conveniences, &c., on the East Hill. Mr. Ben. F. Meadows, town clerk, Town Hall, Hastings.

HOLYHEAD.—Jan. 7.—For erection of an infant school at Kingsland. Mr. R. E. Pritchard, clerk to School Board, Bradford House, Holyhead.

WRAY-WITH-BOTTON.—Dec. 21.—For rebuilding Botton bridge, in the township of Wray-with-Botton, Lancs. Mr. John Marshall, district surveyor, Hornby.

THE contract for the extension of the Rosslare Harbour Pier has now been decided. There were a large number of tenders received, and the lowest was that of Messrs. Brand & Co., of Buchanan Street, Glasgow. Amongst the other great building firms that tendered were Messrs. McAlpine & Co., railway contractors; Messrs. Pearson & Co., railway contractors; Messrs. Jackson and others. The figures ranged between £200,000 and £250,000. The contract of Messrs. Brand & Co. was accepted. The contract is the largest that has been given away in the south of Ireland for the last twenty years. The pier is to be extended 1,000 feet, and the work is to be done within three years.

The "ONE" Range.

PATENT 1331/01.

M. F. CO. LD. R.

These Ranges are Exhibited by the following London Firms:—

R. ADAMS, Newington Causeway;
CLARK, HUNT & CO., Shoreditch;
O'BRIEN, THOMAS & CO., Upper Thames Street;
R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;
ROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—

THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool, and a third oven can be arranged if required.

TRADE NOTES.

A LARGE clock and quarter chimes is to be placed in the tower of Christ Church, Macclesfield. It will be constructed generally to the designs of Lord Grimthorpe, by John Smith & Sons, Midland Clock Works, Derby.

SEVERAL advantages are claimed for a new flushing cistern which Messrs. Holt's Patent Cistern Company are showing at 15 Lord Street, Liverpool; among these we may mention the following:—The supply of water available for flushing never varies; the water level is always $\frac{1}{4}$ inch off the top of stand or

syphon pipe, yet waste of water is impossible; the ball tap remains at full bore until cistern is full (making this cistern the most rapid filler in the market); an after-flush is provided in addition to the main flush; and there are no tight-fitting parts, pistons, valves, &c., to get out of order. This cistern has been in use in a number of hotels, banks, public buildings and rail-

way stations in Liverpool and its vicinity for some time past, and the municipal officers have expressed themselves in such favourable terms in regard to it, that its adoption in several other towns in the north is receiving the careful consideration of their respective governing authorities.

ELECTRIC NOTES.

THE Darlington Town Council have decided to construct and work municipal electric tramways, and to borrow 100,000*l.* for that purpose. The voting for municipalisation was seventeen to three against.

AT Monday's meeting of Ayr Town Council, Mr. Fuller reported that work was proceeding in connection with the placing of arc lamps on the tops of a certain number of the tramway poles in place of the independent arc lamps along the route. He also reported that there were now 494 consumers, the number of lamps connected being 21,136. It was agreed to charge for power and heating purposes from 4*d.* per unit to 2*d.* per unit between 500 and 5,000 units, and by special agreement for quantities beyond 5,000 units.

VARIETIES.

THE new Roman Catholic church of St. Alban, Blackburn, erected at a cost of about 20,000*l.*, has been opened.

THE new mission church of the Good Shepherd, which has been erected in Spon Lane, West Bromwich, at a cost of about 950*l.*, has been dedicated. It is situate in St. John's parish, and will accommodate about 300 worshippers.

THE town hall at Ilford was opened last week. The building has been erected at a cost of about 30,000*l.*, and during the opening proceedings it was announced that some 70,000*l.* had been spent by the Council for the laying out of public parks, 60,000*l.* on drainage, 70,000*l.* for electric lighting and 100,000*l.* for electric trams.

THE new parish hall at Coalbrookdale, Shropshire, has just been completed by the contractor, Mr. T. Pace, of Shrewsbury. Due regard in designing has been paid to its surroundings of wooded hills, the materials employed being Ruabon bricks with Grinshill stone dressings and red Lightmon tiles. The main hall has a semi-octagonal roof with curved and traceried trusses. Mr. Harbottle Reed, of Exeter, is the architect.

A NEW coroner's court at Clapham was opened last week. It has been erected by the Works Department at a cost of 5,500*l.*, with 1,500*l.* for the site, from designs by Mr. Riley, the Council's architect, and seems well adapted for the purposes it is intended to serve. It is situate in the Wandsworth Road, and although the court is not a large one, it is a great improvement on the one which had formerly to be used.

THE prospectus appears of a proposed publication on "Ye Aunciente Hospittall of ye Holye Trynitie, Croydon," founded by Archbishop Whitgift. It will comprise an illustrated and descriptive history from the earliest records, by Mr. Alfred Jones, B.A., warden, while photographs of portions of the ancient building and of the antiquities it still contains will add to the historic value of the book, the price of which to subscribers is 2*s.* 6*d.*

THERE will shortly be published a French translation of the "Methods of Industrial Remuneration," by Mr. D. F. Schloss, of the Labour Department, Board of Trade, of which a third edition was published some years ago by Messrs. Williams & Norgate. One portion of Mr. Schloss's work, that dealing with the tendency of trade unions to restrict output, is of very actual interest, for it deals with a question which has been much referred to of late in the public Press and elsewhere.

THE new station for Dalry, N.B., which is being erected in conjunction with the new line from Dalry to Johnstone, is now in a forward state. The widening at the station to permit of the four sets of rails in place of the two entailed the laborious work of digging away a steep embankment on the east side, but after about five months' work on the part of a big gang of navvies the ground has gradually disappeared, the soil so removed being used for the widening operations further to the north. On the south side of the station some heavy work in the way of cutting has been done. On the east side approaching the junction a massive retaining wall had to be built. The station, which is built of terra-cotta, and comprising spacious booking hall, ticket office, parcels office, agents' room, lavatory, &c., is a handsome structure, and will soon be ready for occupation.

AN amateur dramatic entertainment was given on Monday night at St. George's Hall, Langham Place, in aid of the Benevolent Fund established a couple of years ago in connection with the Auctioneers' Institute. Mr. W. Bennett Rogers (Messrs. Rogers, Chapman & Bennett), the president, was in

the chair. Mr. Haddon Chambers's play, "The Idler," was presented before a large audience and the characters were well represented. Mr. Percy Rogers as Mark Cross, Mr. Mordaunt Rogers as Sir John Harding, and Mrs. Ernest Renton, who was seen in the difficult part of Lady Harding, deserving particular mention. Selections of music were played by Mr. Ling-Bareham's orchestra during the evening. At the close of the performance the artistes were accorded a hearty vote of thanks for their services on the motion of Mr. H. C. Richards, K.C., M.P.

THE restored and enlarged parish church of St. Mary's West Malling, Kent, was dedicated by the Archbishop of Canterbury on the 27th ult. The alterations have been very comprehensive so far as the body of the church is concerned. The whole of the nave, with the exception of a portion of the east and north walls, has been rebuilt with the north and south aisles, and in the reconstruction an extra width of some 15 feet has been provided. Practically the whole of the fabric of the whole of the earlier church in the Italian style, built about a hundred years ago, has been replaced, what Norman work there was being retained in the chancel and tower. The work, which has entailed an expenditure of over 5,000*l.*, has been performed by Messrs. Wallis & Sons, of Maidstone, to the designs of Mr. J. T. Micklethwaite, F.S.A., of Westminster Abbey.

ST. PETER'S CHURCH, Redvales, Bury, was formally reopened on Wednesday last. On a stone tablet in the west porch is the following inscription:—"A.M.D.G. This stone, a memorial of the rebuilding of the nave and aisles, was laid by the Right Hon. the Earl of Derby on November 18, 1899. Peace be within thy walls." The church built about thirty years ago soon began to be a source of anxiety and expense. Nearly three years ago Mr. Medland Taylor, who was asked to report and advise, found that it was unsound and unsafe, and that though it was possible to save the chancel by adding massive buttresses, all the rest of the church must be rebuilt. Drawings and specifications were accordingly made, and the contract let on June 13, 1899, to Mr. Charles Brierley, a parishioner. The general outline of the church is much as before, with three exceptions, namely, the addition of a spacious western porch, the enlargement and remodelling of the vestries, and the removal of the tower to a safer and better position north-west of the north aisle. For the present the superstructure of the tower and spire waits for funds, but the arch behind the

THE committee appointed to organise the sixth International Congress on the Housing of the Working Classes, which will be held from June 15 to June 18, 1902, met in Berlin a few days ago. The ex-Imperial State Secretary, Herr Herzog, was in the chair. The Congress, which meets at Düsseldorf, will be the continuation of those held in Paris in 1889, at Antwerp in 1894, Bordeaux in 1895, Brussels in 1899, and in Paris in 1900. The expenses will be covered partly by the German Government, and partly by a subscription of 10 marks from all persons and Corporations applying for membership. The English, French, or German language may be used during the sittings of the Congress, at which many foreign delegates are expected. M. Siegfried, ex-Minister of Commerce in France, and M. Lepreux, general manager of the Royal Belgian Savings Banks, are among those who are certain to attend. All questions relating to the Conference are to be addressed to the general secretary, Professor Albrecht, at Grosslichterfelde, near Berlin.

ST. EMMANUEL Church, which has been erected in the Christ Church parish, Sparkbrook, Birmingham, was consecrated recently by the Bishop of Coventry. The church, which is in the Decorated style, has been built by Messrs. Moffatt & Son, of Camp Hill, in accordance with plans prepared by Mr. W. Hawley Lloyd, architect, of Bennett's Hill, but the whole of the original scheme has not yet been carried out. The site is of sufficient extent to allow of the erection at a future time of other parochial buildings. The church is a neat brick erection, with stone dressings; it has a bell-turret for the accommodation of three bells, and is surmounted by a minaret of stone. When completed it will accommodate over 700 worshippers, but the present building, which consists of chancel, organ-chamber, large vestry, chancel aisle and two bays, the latter with lofty traceried windows, will seat about 430 persons. The present cost is about 5,000/. At the east end there is a fine traceried window and the seating is on the chair system.

PLANS for a landing-stage for steamers were laid before the meeting of the Rhyl Urban District Council. It was decided to send the plans forthwith to the Board of Trade, the work to be proceeded with when the site is approved by Parliament.

BUILDING AND BUILDERS.

BUILDING operations commenced this week in connection with the new town hall for Cheltenham, which is to cost 40,000/.

THE Ayr Town Council have accepted the tender of Messrs. Macfarlane, Strang & Co., Glasgow, amounting to 7,481/ odd, for the cast-iron pipes, &c., required in connection with the extension of the waterworks.

MR. E. A. SANDFORD FAWCETT, A.M.I.C.E., has held an inquiry at Bardney as to the sanction to a loan of 3,000/ for carrying out a waterworks scheme prepared by Mr. J. R. Elliott, A.M.I.C.E., of Nottingham.

AT a meeting of St. Andrews (N.B.) kirk-session held on the 5th inst. a committee was appointed to consider what steps should be taken with a view to the restoration of the town church. It was resolved to call a public meeting on the subject early in January.

THE growth seaward of Dungeness Point has led to the necessity for a new lighthouse there, and a Deal firm have contracted to carry out the work for 6,000/. This will be the third lighthouse erected upon Dungeness Point. The first, built about sixty years ago, is now a mile inland.

THE London and South-Western Railway Company intends considerably enlarging the Andover Junction to meet the military requirements of Salisbury Plain, and have given notice of applying for powers to take in land at Andover for this purpose.

THE memorial-stone of the new rectory at present being erected in Hope Street, Falkirk, in connection with the St. Francis Xavier's Church has been laid and consecrated in accordance with the rites of the Roman Catholic Church by the Archbishop of St. Andrews and Edinburgh.

THE Poplar Borough Council has received particulars concerning the new Bow bridge which is about to be erected by the London County Council in conjunction with the Essex authorities. It is proposed that the new bridge shall be 70 feet in width, with a headway in the centre of the span of 8 feet 7 inches above high-water level, or 2 feet higher than the present bridge.

AT a meeting of Avondale School Board Mr. Robert Sandilands, I.M., 154 West Regent Street, Glasgow, was appointed measurer for the new public school about to be

erected in Strathaven, N.B., to meet the requirements of the Education Department. The architect, Mr. Cullen, Hamilton, was also instructed to prepare the plans for the approval of the Department. A site in Lethame Road has been agreed upon, and the cost of the school is supposed to be 12,000/.

THE York School Board spent nearly two hours on Friday evening in the discussion of a recommendation of the sites committee that plans submitted be forwarded to the Board of Education, with a view to the erection of a school on the Poppleton Road site—a matter on which the recent School Board election largely turned. The resolution was adopted by six votes to five, and it was agreed that the building be described on the plans as the Poppleton Road school.

THE Mayoress of Newcastle laid on the 5th inst. the foundation-stone of the new home of the Northern Counties' School of Cookery and Domestic Economy in Northumberland Road, Newcastle. The new building will be the first erected in the provinces for the sole use of teaching cookery and domestic economy. It will cost upwards of 10,000/., and has been planned after a careful inspection of all the more important training schools of household cookery in the country. It will provide for the simultaneous practical instruction of about 200 students in cooking, laundrywork, dressmaking, millinery and general housewifery.

AT the estate committee of the Liverpool Corporation on the 5th inst., Councillor Brownbill attended and explained his scheme for a combined central railway station near the George's Dock. His proposal is to remove the Goree Piazza warehouses and to place a station extending from James Street to Water Street under the level of the roadway, which might be used by the railway companies running into Liverpool. The committee listened with interest to Mr. Brownbill's statement, and decided to ask the city surveyor and the city engineer to consider the matter and communicate their views to the chairman of the committee, who in turn will lay them, in the form of a memorandum, before the committee.

THE foundation-stone was laid on the 7th inst. of the new National day and Sunday schools which are to be erected in Spring Gardens, Churchgate, Stockport. The site of the present schools and the building at Wellington Road South, directly opposite the Stockport Infirmary, have been acquired by the Corporation with a view to the erection of a town hall and municipal buildings. The new schools will cost about 8,000/.; they are erected on an acre of glebe land given by the Rev.

Canon W. Symonds, rector and rural dean, and will be ready for occupation in the spring of next year. The buildings occupy an elevated site; there are separate departments for boys, girls and infants; and a fine assembly-room, the accommodation being for 600 day scholars.

At a special meeting of the Bridlington Town Council, the mayor (Councillor Nightingale) presiding, Councillor Bailey (chairman of the property committee) brought forward a proposal involving the lengthening of the present Prince's Parade 223 feet, and a projection seawards 125 feet, with a pavilion upon it to accommodate 3,000 people. According to the plan submitted by Messrs. Mangnall & Littlewood, of Manchester, who will be the architects for that part of the scheme, the Victoria wooden jetty will be replaced by three terraces, with two colonnades, 80 feet and 70 feet long respectively, upon them, and in addition a carriage drive 300 yards long from the Esplanade to Beaconsfield. The total cost of the entire work is roughly estimated at 35,535/.

LORD ROWTON visited Birmingham a few days since and discussed with a number of gentlemen interested in the housing problem a proposal to establish a Rowton House in the city after the style of the establishments in London. It is intended early in the new year to raise a share capital of 40,000/., which will be sufficient to provide a home for 600 men. Lord Rowton pointed out that if the scheme was to succeed it must be a big one. He began with providing accommodation for 800 men and 200 beds had to be added. In Manchester there was a scheme for 300 beds, but it proved too small and unremunerative. He suggested that in Birmingham 700 beds should be aimed at, and he thought a 4 per cent. return on the capital was assured. At Southampton, where only 260 beds were provided and no extension was possible, there was endless trouble notwithstanding that the lodging-houses were well conducted.

BURBAGE parish church, in the heart of the Peak of Derbyshire, and within a short walk of Buxton, is about to be enlarged and, in some respects, remodelled and improved. New windows and better accommodation for the choir, together with a thorough repair of the fabric and an artistic decoration of the interior, form part of the scheme. A lady parishioner has promised a new altar, which is to be of the choicest Derbyshire marble, and it is hoped that other gifts will follow. Mr. T. W. Staniforth, the vicar's churchwarden, has taken the initiative in the matter, and hopes are being

WM. E. PECK & Co.
8, BRADFORD AVENUE,
LONDON, E.C.

entertained that ere long Burbage will possess a church with an interior less gloomy and depressing than as at present, and one, too, more in accord with the romantic and charming scenery which surrounds it.

THE Government are about to provide additional barracks on Salisbury Plain to accommodate eight battalions of infantry, and the contract for the work, which it is expected will entail a cost of about 1,000,000/., has been given to Mr. Henry Lovatt, builder, of Wolverhampton, who has carried out a number of important and valuable contracts in various parts of the country. The barracks are to be erected at the foot of Clarendon Hill, and will run from east to west, and extend a distance of a mile and a half. The buildings will include thirty-two double company blocks, for men's quarters, canteens, sergeants' mess, band-rooms, drill sheds, guard houses and officers' and commanding officers' quarters. It will also be necessary to build a village to accommodate the large number of men required to be employed on the works, and the location for it will be Brimstone Bottom, between Tedworth and Ludgershall, about a mile and a half away. Two railway lines have been constructed by the War Department to carry the materials from Tedworth station to the site of the new barracks. It is expected that the work will be commenced almost immediately.

In consequence of the developments that have taken place in connection with the proposed dock construction on the river Dee, it has been found necessary to make certain alterations with respect to the tunnel which is to be laid under the Dee by the Town Council to carry the sewage of the city to the outfall at Girdleness. The line of the tunnel is now to be shifted about 120 yards further east than was originally proposed, and is to be placed at a lower level, the uppermost outside surface to be not less than 41 feet below the level of high water of ordinary spring tides, or about 20 feet below the present bed of the river. With an ultimate depth in the channel of 25 feet at low water of ordinary spring tides, this will give about 4 feet of cover above the tunnel, and will, it is believed, afford sufficient protection against any damage to the structure. The estimated cost of constructing quay walls, with provision for protecting the tunnel, amounts to 5,900/.. Of this outlay the Town Council will pay 2,500/., in consideration of the extra cost to which the Commissioners will be put for works required to protect the tunnel, this sum to be increased or reduced proportionately as the actual expenditure warrants.

THE housing sub-committee of the sanitary committee of the Manchester City Council have decided upon plans for the model cottages to be built at Blackley. In a degree the plans approved follow the lines adopted in the building of model cottages at Leek, in Staffordshire, and have several improvements as compared with the original design. The chief additions are a bathroom and a bedroom, the former room being placed on the ground floor immediately behind the kitchen fireplace. Access to it is obtained from the scullery, from which it can at pleasure be cut off when in use by folding doors. The bathroom is to be made available for washing purposes generally. The third bedroom is to be in the centre of the building, the floor being 3 feet 6 inches higher than that of the other bedrooms. So far as the cost is concerned, the alteration in the original scheme for the erection of 233 cottages will involve an additional outlay of 7,000/., and application to borrow this sum will have to be made to the Local Government Board if the plans are adopted by the City Council.

THE report of the Lunatic Asylums committee of visitors to be presented to the Birmingham City Council in January states that considerable progress has been made with the new asylum at Hollymoor. The boiler-house, engine house and water-tower walls have been erected to a height of about 7 feet above the ground, the chimney-stack to about 33 feet, the bake-house to about 3 feet and the male and female attendants' homes to about 8 feet above ground. The greater part of the basement work, from the boiler-house to the front corridor, has been completed. As regards the kitchen department, dining-hall, and female working patients' block, the foundations are in to the ground line, while in the male working patients' block the excavations are nearly completed. The isolation hospital is in an advanced condition, the greater part of the roofs being boarded and felted ready for slating. This portion of the work has been proceeded with as rapidly as possible, in order that accommodation may be provided for patients from Rubery Asylum in case of an outbreak of infectious disease, attention having on more than one occasion been called by the Lunacy Commissioners to the need for such provision when visiting the Rubery Asylum. Of the eight attendants' cottages, four have been roofed in complete, and in the remaining four the roof timbers are fixed for slating. It is understood that these will be occupied for the present by some of the contractor's employes, a suitable rent being paid for their use. Up to November 22 last 2,026,000 bricks had been made upon the ground for use in the building.

THE UNION PLATE GLASS CO., LTD., POCKET NOOK, ST. HELENS

Telegrams, "Union, St. Helens." Nat. Tel. 48.

ESTABLISHED 1837.

Makers of Ground, Smoothed, Polished, Silvered, Bevelled, Brilliant Cut, and Bent Plate Glass; Rough Rolled and Rough Cast Plate Glass; also of Rough and Polished Prismatic Glass, &c., &c.

SPÉCIALITÉ: "REFRAX" (Protected under Patent Acts).

Extracts from Testimonials received:

"The 'Refrax' Glass is a GREAT IMPROVEMENT."

"Gives EVERY SATISFACTION."

"The Glass I am perfectly satisfied with: GREAT SUCCESS."

"Compared with Polished Plate Glass 'Refrax' gives TWICE AS MUCH LIGHT for EQUAL COST."

Sold by all Dealers.

Interior Lighted by ordinary Plate Glass.

Same Interior Lighted by "Refrax" Glass.

VENTILATION AND WARMING

By Mechanical Means, with Filtered, Washed, Warmed, and Humidified Air.

THE AIR OF APARTMENTS CHANGED FROM 8 TO 16 TIMES PER HOUR WITHOUT DRAUGHTS. ALL BUILDINGS DONE CAN BE REFERRED TO.

MADEIRA IS BROUGHT TO BRITAIN.

ARTISTIC GLAZING.

WE recently had an opportunity to inspect some examples illustrating a new style of ornamental glazing, which is being introduced to the London market by Mr. Albert Becker, of 22A Chapel Street, Milton Street, E.C.

The invention of Messrs. Gustav Schulze & Jost of Berlin,

No. 1.

the system is admirably adapted to high-class work, and while what are known as "new art" designs predominated among

the specimens shown to us, the method is equally applicable to any other style.

The principal novelty about it is the employment of various metals, as copper, brass, nickel, or iron, in place of the lead ordinarily used, and as these metals, which are finished alike on both sides, are of some substance, they not only add greatly to the strength of the finished work, but also impart a highly ornamental and artistic aspect to it, an idea of which may be

No. 2.

formed on glancing at the illustrations which we are able to give herewith, of which No. 1 is in massive brass (finished on both sides), with bevelled crystal and American opalescent glass, and No. 2 in brass similar to No. 1, but glazed with bevelled crystal and English mosaic glass. We need hardly add that any description of glass may be employed according to the effect which it is desired to produce.

THE MAY-OATWAY FIRE ALARM

Licensed by H.M. Postmaster-General.

No greater fire loss than £10 has ever happened in any building protected by this system, and no one has ever been injured or lost. Whether the premises are occupied or not it is impossible for any fire to burn for more than a few seconds without giving its own alarm, and that at a period early enough to insure its suppression by half a dozen buckets of water. Approved by every Tariff Insurance Office and Fire Brigade in New Zealand, and solely used by the Government of that Colony for the protection of national property where the lives of inmates are concerned.

SIR EYRE M. SHAW (late London Fire Brigade), Chairman.

6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON E.C.

DILATORY WORKMEN.

In a speech delivered at Bolsover on Saturday, Earl Gray said that the building trade furnished the greatest illustration of the evils which result from restriction of output. In this business there was no international competition. The builders of New York could not compete with the builders of Bolsover, and the builders of Bolsover could not compete with the builders of London. The evil results of regulations restricting the output were consequently not apparent; but what was the effect upon the community? Owing to the restrictive regulations which doubled the cost of labour the building of houses was checked, with the result that the rents were increased and that the working classes were compelled to live in overcrowded houses. A Royal Commission had reported in 1884 that twenty days a year were lost upon the lowest average to every working man and every working woman from simple exhaustion occasioned by the vitiated air of overcrowded dwellings. The position was worse to-day. Mr. Rowntree, in the important book he had just published on the study of town life, had pointed out that in York 88 per cent. of their working class population were living in houses which left much to be desired, and 30 per cent. of the population were living in poverty and were ill housed, ill-clothed and ill-fed. The chief cause of this sad state of things was the restriction of output which increased the cost of building, raised the rents, caused overcrowding, produced debility, which in its turn drove people to drink. What was wanted was the application of copartnership principles and the imitation of the example set by Mr. Bainbridge, who had endeavoured to secure for his workmen the advantages of the towns and the fresh air of the country.

WORKSHOP ORGANISATION.

At the ordinary meeting of the Manchester Association of Engineers held on Saturday, Mr. Henry Webb presiding, a paper was read by Mr. A. P. Loscher, of Manchester, on "Workshop Organisation." He said that in these days of keen competition the perfection of labour-saving tools and machinery had made such rapid progress as to revolutionise the organisation of workshops and the methods of production. Modern workshop organisation and timely specialisation of production had borne such excellent fruits in America, and in later years in Germany, that it was surprising that similar

methods had not been universally adopted. Too many engineering works were practically void of even the most elementary points of organisation, and did not possess either toolrooms or stores or any proper system for the execution of orders, whilst the cost of such orders was too often merely guesswork. The writer described in detail an elaborate plan of systematising engineering work. He then went on to say that although much had been written of late about the advantages of an intensified or differential rates system of wages over the piecework system and over the premium or profit-sharing system, he had not heard of any factory here adopting the first. The fixing of rates by scientific methods and the fixing of maximum outputs for men and machines were, he said, the foundation of economical and successful production. What a workman could produce in a given time, and what he actually did produce presented widely different results. The ordinary plan, which failed owing to a lack of recognition and reward for the workman's individual capacity, was to regulate a man's wages by the position he held, thus placing a highly skilled man on the same level as those of less intelligence or ability. The differential system, on the contrary, offered better terms to the willing and industrious workman than any trade union was even trying to secure for its members. The absolute want of even an elementary education by a large number of working men made it very often extremely difficult to introduce any new system of organisation, pay or machinery. He recommended as a step towards improving this state of things that every apprentice should be compelled to attend regularly at one of the numerous evening technical schools. Compelling apprentices to work on strictly modern lines would, he thought, greatly assist in successful organisation, and would also weaken the resistance of those journeymen who were still under the influence of trade union principles. The proprietors of up-to-date workshops saw to it that they had the best tools and conveniences, in well-lighted and well-ventilated workshops, knowing that if they were to turn out the best class of work it was necessary to consider the welfare of the workmen. Mutual benefit, he said, could only be secured by offering full scope for the workman's experience, knowledge and ambition.

The paper was followed by a discussion.

THE foundation-stone was laid on the 4th inst. of a new Wesleyan chapel which is being erected at Stapenhill, Staffs. The cost of the building is estimated at about 2,500l.

JOHN SOPER, Manufacturer

OF EVERY DESCRIPTION FOR INSIDE AND OUTSIDE.

ROLLER BLINDS in Striped or Printed Hollands, from 5d. per square foot.
 SPRING ROLLER do. from 7d. per square foot.
 VENETIAN BLINDS (of thoroughly seasoned Pine) from 7d. per square foot.

CARNEGIE RESEARCH SCHOLARSHIPS.

MR. ANDREW CARNEGIE lately presented to the Iron and Steel Institute debenture bonds of the value of 64,000 dols. for the purpose of founding a research scholarship or scholarships, at the discretion of the Council of the Institute. Mr. Bennett H. Brough, the secretary of the Iron and Steel Institute, has now issued a circular giving the conditions upon which the Council have decided that the scholarships shall be awarded. The competition is irrespective of sex or nationality, and the circular has been translated into French, German, Spanish, Italian, Swedish and Russian, and will be circulated in those countries. Candidates, who must be under thirty-five years of age, must apply on a special form before the end of March to the secretary of the Institute. The object of this scheme of scholarships is not to facilitate ordinary collegiate studies, but to enable students who have passed through a college curriculum, or have been trained in industrial establishments, to conduct researches in the metallurgy of iron and steel and allied subjects, with the view of aiding its advance or its application to industry. There is no restriction as to the place of research which may be selected, whether university, technical school or works, provided it be properly equipped for the prosecution of metallurgical investigations. The appointment to a scholarship shall be for one year, but the Council may at their discretion renew the scholarship for a further period instead of proceeding to a new election. The results of the research shall be communicated to the Iron and Steel Institute in the form of a paper, to be submitted to the annual general meeting of members, and if the Council consider the paper to be of sufficient merit the Andrew Carnegie gold medal shall be awarded to its author. Should the paper in any year not be of sufficient merit the medal will not be awarded in that year.

CHEAP HOUSES IN LIVERPOOL.

In a letter to the *Liverpool Courier* Mr. Edward Mines, a builder, writes:—Having built some hundreds of houses for the working class in Liverpool it may interest some of your readers to know how the housing question is viewed by a builder.

I firmly believe that the building by-laws are the source of all the trouble. Our health committee (prompted, I suppose,

by our city surveyor) seem to have such an abhorrence of the two words "jerry" and "insanitary" that they have gone the other extreme. Just compare the by-laws of fifteen years ago with those of to-day. Ten years ago it was possible to build a three-storeyed house of six rooms for 75%. To-day under the present by-laws, the smallest house permissible of four rooms cannot be built under 150%. Ten years ago a six-roomed house could be let at 4s. per week as a paying rent and the very poor, who could not afford even this rent, could let off two or three rooms. To-day the smallest four-roomed cottage cannot be let under 6s. per week as a paying rent.

This is due, slightly only, to increase in price of building material and labour, but chiefly to the very severe and restrictive by-laws of to-day. Every few years seem to bring in some new and drastic by-law in the building of cottages, which only serves to increase the rent, and cause private enterprise to withdraw from the erection of such houses. I wonder if our worthy surveyor, or any member of the health committee, could explain, among others, the necessity for the following by-laws over those of fifteen years ago:—

Increase in Strength of Main Timber.—In pulling down insanitary property which has been standing considerably over fifty years the main timbers are found to be in perfect condition, yet the same strength of timber over the same span would not be permitted by our present-day by-laws, greatly increased strength being considered necessary.

Nine-foot Back Passages.—Five years ago I built a block of cottages, and by the new by-laws was compelled to put a 9-foot passage behind them. I was then made to pave the same with stone, which had to be brought by rail from another part of England, our local stone not being thought by our worthy engineer hard enough for such an important passage. This cartway, upon which no vehicle has ever been seen, has so added to the cost of the cottages abutting thereon that a further 4d. per week rent is demanded from each tenant. What was the 9-foot passage for? Not air space, as that is dealt with in other by-laws, but our surveyor says for "sanitary reasons," or, in other words, so that refuse carts can get down daily to empty the ash-bins. Then, why are the sanitary authorities supplying to builders ash-bins that work on a swivel to turn the refuse direct into wheelbarrows? And why do the refuse carts wait at the end of the street while the refuse is brought in barrows to them? The old 4-foot passage was quite wide enough for this.

GILBERT WOOD & CO. Ltd., 6-11 Imperial Buildings, Ludgate Circus.

Width and Surface of Streets.—The by-laws of to-day under his head are extravagant beyond all reason, and they seem to be pressed to their utmost by those in authority. Only a few days ago I was informed by one of the chiefs of our engineer's office, referring to some hard kerb stone that had been brought from Yorkshire and laid in a road in Liverpool in front of cottage houses, that his department would not pass it; they must have granite kerbs, and he gave an instance of some York kerbs which had been put down in another part of Liverpool for about fifty years "showing considerable signs of wear." No courts are now allowed in front of cottage houses, but a street of from 30 to 36 feet must be made, yet large hotels, office buildings and even large workmen's dwellings and hotels now being built by the Corporation are just ferreted with courts, and have much less air space per person than our former courts. At a low estimate the streets now demanded by our building by-laws, with the making of them, have added one shilling per week to the rent of our present cottages for the working class.

Even now our surveyor and health committee are not satisfied. They purpose placing before Parliament next session a Bill for all streets to be made before starting to build. This, if passed, will add at least another penny on to the rent of a cottage house. I hope the new edition of the building by-laws about to be published by the building surveyor will not be used solely in the future by the Corporation themselves as builders, or the ratepayers may have cause to inquire into greatly increased rates. Builders are unanimous in thinking that all new by-laws relating to improved and up-to-date methods of draining are absolutely necessary, but most of the others are beyond all reason.

TALLA WATERWORKS.

THE works committee of Edinburgh and District Water Trust held a special meeting for the purpose of having an interview with Mr. Hill, consulting engineer, Manchester, in regard to the state of the Talla works, of which he has just completed a special examination at the request of the trustees. Asked as to the delay which had taken place, Mr. Hill said that speaking generally it was due to the extended length of the trenches and the difficulty of getting a good solid bottom. That had now been secured, and nothing could be better. The clay puddling had been delayed until the excavations had been

thoroughly made. As showing that difficulties of this kind were not uncommon, Mr. Hill mentioned that in connection with the Glasgow waterworks it was necessary to go over 200 feet deep to secure good sound bottom. There was no way of doing work of this kind except to reach solid foundation, no matter how much delay might be caused. To stop the leakage in the roof of the tunnel at the Talla, he proposed to extend the puddle trench over the top of the tunnel, so as to cut off the reservoir from the outside. In Mr. Hill's view the packing of the tunnel had been defective, but as he would be arbiter in any question which might arise, he declined in the meantime to give any expression of opinion as to who was responsible. For the same reason he declined to allocate responsibility for the partial collapse of the tunnel near Penicuik. No doubt it would have been better to have had the inverts into that tunnel. Unless exceptional circumstances arose he thought the works should be completed in from two to three years. The getting of men was the great difficulty, and even if the wages were raised the relief would be only temporary, because a similar rise would take place over the whole country, and matters would again be where they started. As a rule he never pressed contractors for three or four months during the winter, as the work could make little or no progress during that time. Mr. Hill was asked if he could give any reason why the filter-tanks at Fairmilehead were to cost 200,000*l.*, exclusive of land, whereas the Alnwickhill tanks, which had the same capacity of 9,000,000 gallons a day, and were admitted to be the best in the country, cost 57,000*l.*, including land, at a time (1878) when labour and materials differed little in price from the rates now current. Mr. Hill agreed to submit in writing a detailed report on that subject, and also on the proposed augmentation of the present supply by making certain connections from one reservoir to another.

IRISH RAILWAYS.

A PAPER was read by Mr. Joseph Tatlow at the last meeting of the Institution of Civil Engineers of Ireland on the "Progress of Irish Railways." He said that the community at large knew but little of the steady and substantial progress which, despite a diminishing population, had been made by the Irish railways during the last ten years. The railway returns of the Board of Trade and the census tables disclosed facts which were interesting and instructive, and he proposed to examine

THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE.

"PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of

WATERTIGHT GLAZING without PUTTY.

NO OUTSIDE PAINTING REQUIRED. PERFECTLY DUSTPROOF.

Wherever adopted saves 95 per cent. in maintenance.

Curved Roofs can be Glazed with Straight Glass

SUITABLE FOR ALL KINDS OF ROOFING, such as Weaving Sheds, Engineering Workshops, Railway Stations, Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric Light Works, and Horticultural Buildings of every description &c. &c.

This System allows for full expansion and contraction of glass, and absorbs any vibration by machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

ESTIMATES AND DETAILED DRAWINGS SUPPLIED ON APPLICATION.

IMPORTANT NOTICE

To Shipowners, Shipbuilders, Contractors, House Builders and Painters, and others.

The Products specified below are unrivalled, and have only just been introduced into this country.

The "PERFECT" Universal Cleaner, for removal of Old Paint and Varnish from Wood, Iron, Steel, or Stone. Magical in action. Guaranteed not to injure material, and new Paint or Varnish may be at once applied.

MORPHYRINE.—A Liquid for Dressing Walls of New Houses, to prevent Damp, and so that Paint or Paper may be put on at once, and for Removing Damp in Old Houses. This is a really wonderful preparation.

EROPHILE.—A Liquid for Removal of Rust.

EXCELSIOR.—A Paste for Prevention of Rust.

SOLE AGENT FOR UNITED KINGDOM.

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

their impartial statistics and to show not only the positive progress of the Irish railways during the decade, but also their relative progress as compared with the railways of England and Scotland. Population affected all statistics relating to commercial undertakings, and he would draw attention to the striking fact that whilst the population of England had increased by 9·13 per cent., and of Scotland by 4·69 per cent., the population of Ireland decreased by 4·29 per cent. during the period under review. This decreased population meant much more than the mere probability of a relatively less number of railway passengers in Ireland than in the sister countries. It meant that in Ireland thousands had annually left their native land because their native land was poor, because it could not furnish them with the means of support, whereas England and Scotland were rich, and their prosperity was so great that an ever-growing population lived upon their resources under conditions of yearly increasing comfort. In 1890 the paid-up capital of Irish railways was, in round figures, 37,298,000*l.* This in the year 1900 had risen to 39,369,000*l.*, being an increase of over 5½ per cent. In England during the same period railway capital had increased by 18 per cent., and in Scotland by 22 per cent. In the case of Ireland the figures do not represent the whole of the capital expenditure on Irish railways, as during the period free grants were made by the Government towards the construction of railways for opening up poor districts, amounting to about 1,500,000*l.* If this sum is included the increase in the capital of the Irish railways amounts to nearly 10 per cent. What these railways have accomplished for the trade of the fisherman is evident when it is said that in the year 1890, before any of them were constructed (the Act for their construction being passed in 1889), the total quantity of fish traffic railway borne in Ireland was under 8,000 tons, whereas in the year 1900 it had increased to close upon 16,000 tons, an addition of 100 per cent. The amount of additional rolling stock which has been provided in Ireland during the decade, and in the face of a continually diminishing population, was remarkable. During that period 118 engines, 541 passenger carriages and 3,862 waggons have been added to the working stock of the companies. These, at a moderate estimate, would cost more than a million pounds sterling, which has been expended for the better-carrying on of the railway business of the country. In 1890 the number of train miles run in Ireland were 13,600,000, and in 1900, 17,300,000, being an increase of 27 per cent. It would naturally be expected that England and Scotland would

show much higher figures, but in England the increase only amounted to 28 per cent., and in Scotland to 30 per cent. The number of passengers carried in Ireland in the year 1890 was 21,400,000; in 1900, 27,600,000—an increase of about six and a quarter millions, or 29 per cent. For the conveyance of these passengers the money received by the companies increased by 19 per cent., the average amount paid per passenger having fallen from 1*s.* 3*d.* in 1890 to 1*s.* 1½*d.* in 1900. Another item of railway business which is satisfactorily increasing is the periodical or season ticket traffic. Since the opening of the decade the increase in the number of these tickets has been 40 per cent. in Ireland, as against 38 per cent. in England and 49 per cent. in Scotland. In Ireland the increase in goods traffic is close on 20 per cent., compared with 27 per cent. in England and 35 per cent. in Scotland. In goods traffic is included minerals, the chief item of which is, of course, coal. With regard, however, to live stock traffic, Ireland is far ahead, the comparison of receipts being for England a decrease of 0·32 per cent., Scotland an increase of 7·47 per cent. and Ireland an increase of 16·96 per cent. during the decade. In the year 1890 the Irish railway receipts from live stock traffic were 263,000*l.* In 1900 they reached 307,000*l.*, the increase being 44,000*l.* Comparing the total railway traffic receipts per head of population, the figures show an increase of 27 per cent. in Ireland, 30 per cent. in Scotland and 20 per cent. in England, so that the total railway traffic of Ireland has per inhabitant developed at a much greater ratio than that of England. Net railway receipts have increased in Ireland by 12 per cent., as against 7 per cent. in England and 23 per cent. in Scotland. The net revenue sufficed to give a return upon the paid-up capital in the case of the Irish railways at the rate of 3*l.* 17*s.* 10*d.* per cent., of the Scotch railways at the rate of 4*l.* 2*s.* 2*d.* per cent., and of the English railways at the rate of 4*l.* 0*s.* 5*d.* per cent. Shareholders of the Irish railways have, therefore, to be content with smaller profits than holders of English and Scotch railway stocks, and no one can regard an average of 3*l.* 17*s.* 10*d.* per centum as an unreasonable return to those who furnished the funds for the construction of the Irish railways. The record of the last decade of the railways of Ireland is distinguished by enterprise, improvement and progress. In conclusion Mr. Tatlow expressed a hope that the Irish railways would recover their elasticity, and that the present decade would end more brightly than it had begun.

THE WEEK.

WHEN the London Building Act was passed in 1894 it was not anticipated that the Metropolis was afterwards to be divided into several boroughs. The London Government Act of 1899, in granting to the boroughs certain privileges, enacted that in case doubts should arise as to whether any power, duty or liability was or was not transferred by the County Council, the decision was to be left to the High Court. The application which was made on behalf of the City of Westminster on Monday in respect of the right to examine and license any temporary wooden structures which will be erected within the boundaries of Westminster for spectators of the Procession in June was one of those doubts. As our readers are aware, Part VII. of the Building Act relates to special and temporary buildings and wooden structures. By section 82 application is to be made to the County Council for approval of any structure which it is proposed to erect, and the Council have the right to make regulations on the subject. By section 83 the control of the structures is left with the County Council, and by section 84 no wooden structure is to be erected, except hoardings enclosing vacant land, without license having first been obtained. Now the question at issue was, whether the County Council was deprived of that power by the London Government Act or still retained it. Simple as the issue may appear, it is not one with which a court would care to deal. The Court of King's Bench Division, consisting of the Lord Chief Justice, Mr. Justice DARLING and Mr. Justice CHANNELL, therefore avoided entering into a consideration of all the collateral issues which belonged to such a case. The court was content to say that section 84 seemed to give control over wooden structures, and the powers under section 84 had been transferred to the City of Westminster. The manner of treating the subject is enough to suggest that many other questions are likely to arise relating to building which will have to be painfully determined in the High Court.

THE sites and buildings committee of the Birmingham School Board have recommended that three months' notice be given to Messrs. MARTIN & MARTIN, architects and surveyors, to terminate their engagement. All work which they have now in hand for the Board is to be completed by them on the existing terms. The Board will advertise for an architect to be the architect to the Board for new works, at a rate of remuneration of 7s. 6d. per scholar of accommodation, plus 1½ per cent. for taking out and furnishing quantities, the engagement to be for three years, with a clause for determining the same at three months' notice on either side at any time; the Board will advertise for a land surveyor at a commission of ¾ per cent. on the purchase money, and the Board will also advertise for a superintendent of buildings for alterations and repairs, at a salary of 250l. per annum, to devote all his time to the duties and to work in the Board's offices, all necessary office furniture, stationery, &c., being provided by the Board. The proposals show a desire for again experimenting with the architectural work of the School Board. Birmingham is unique in that way. Originally Messrs. MARTIN & CHAMBERLAIN obtained all the commissions. Then for a short period the competition system was tried. Next Messrs. MARTIN & MARTIN were selected to build any additional schools required, and now there is to be a Board's architect who will not be paid a fixed salary. We do not suppose the new arrangement will be final, and there may yet be novel methods introduced for obtaining plans.

THE perversity of the London County Council in supporting the Works Department at all costs was once more exemplified on Tuesday. The report of the finance committee demonstrated that the losses of the department amounted to 78,000l., and there are some people who believe that a still larger sum would be more exact. Yet in spite of the appalling figures it was decided by a majority of 56 votes that the lodging-house which it is proposed to erect in Deptford in imitation of the Rowton Houses is to

be carried out by the Works Department. The building is estimated to cost 51,500l. In the course of the long discussion there was not one argument brought forward to prove that a better and cheaper lodging house will be obtained under departmental influence than is possible with an ordinary contractor. If the County Council would frankly admit that their aim is not economy but the rewarding of a numerous class of voters, then their position would be understood. It may be right to expend public money in that way, but what we must protest against is the subsidising of a class and calling it economy.

THE same plans can be used sometimes for more than one building, but it is not always wise to inform clients of the circumstance. Mr. BARRETT, an architect in Bognor, has failed in an action brought for the recovery of his fees through announcing that the plans prepared for the defendant could be used elsewhere. The defendant intended to erect a house on the Highfield estate, near Bognor. Plans and specifications were prepared and tenders were received in August 1899. No tender was accepted. In March 1900 the plaintiff joined the Imperial Yeomanry and went out to South Africa, but before departure he informed defendant that a qualified architect was to look after Mr. BARRETT's business. The plans were returned to plaintiff, as he said they were to be used in connection with other work. On Mr. BARRETT's return to England he found that the defendant had purchased a house instead of erecting one, and he therefore applied for 23l. 13s. 6d., the fees for preparing plans and specifications. Not receiving the amount, it was necessary to bring the case into the county court. Defendant contended that he could not proceed with the work, as there were no plans, and he was not informed about the representative of Mr. BARRETT, who by joining the Army had abandoned the commission. It was not stated that any inquiry had been made about the representative. Moreover, it could easily have been shown that plans are not always left with the client. The Judge, however, accepted the defendant's view, and decided for him, with costs. The judgment is not encouraging to architects who are ambitious to serve their country in an emergency.

THE judgment of the Irish King's Bench Division in the case of the King (CODDINGTON) v. the Local Government Board has an interest that is more than local. The question involved was whether a Government Board and a Rural District Council could compulsorily acquire land without first endeavouring to satisfy owners and tenants. Instead of the three acres which is the normal area in England, half-acre plots were acquired in Ireland as sufficient land to be attached to labourers' cottages. Afterwards it was proposed to add another half-acre to each plot, and this was done without adopting the usual means of agreement or exchange. Colonel CODDINGTON, who is a large ratepayer in the district in question, sought to obtain a prohibition of so summary a process, but the Court decided that "authority to purchase" included compulsory purchase. The prosecutor therefore failed to establish his case, and will have to pay costs. We hope this arbitrary precedent will never be followed in England, where the Lands Clauses Acts are rarely put into operation until public authorities or railway companies have failed to come to an agreement with owners and occupiers of lands and houses.

THE German explorers in Babylon have made an unusually interesting discovery. Inscribed tablets of clay are common enough, and examples of them are to be found in the principal museums of Europe. But in the excavations at Nischan-el-aswad 400 tablets have been discovered, many of which are of a novel character. Several may be considered as of the belles-lettres class. They were evidently used for teaching, and therefore may be regarded as presenting examples of the Classic literature of Babylon. Some served as a dictionary, and on that account will be interesting to philologists. There is also a hymn which was chanted during the processions in honour of the god MARDIK, whose temple has been brought to light by the German explorers. In another part of the same district the Temple of Adar or Ninev, the protector of physicians, has been discovered.

PROGRESS OF THE GEOLOGICAL SURVEY.

A REPORT on the geology of Great Britain should give rise to thankfulness that our country, although limited in area, is so marvellous an epitome of the world. In its formations it is truly representative of the great globe itself. There may be rocks which are found on a great scale in other countries, and which are visible here in only insignificant quantities, but it would hardly be an advantage for us if we had no more than the exact proportion of every one of them that would correspond with the magnitude of our two islands. Who, for instance, would sacrifice the coal formation for the more picturesque dolomites? It is only, however, by degrees that we are discovering the extent of our geological riches. The difference between the homogeneous and the heterogeneous of the evolutionist could be amply illustrated by a consideration of the history of geological study in Great Britain. At first the divisions were few, but as time went on there were subdivisions, until now, when it would be risky to describe any group as more than a temporary approximation. The change is owing to the immense interest which has always attended the study of geology, and the number of workers who have been ready to come forward in order to examine rocks under all circumstances. But the credit for the present position of the science must mainly be ascribed to the staff of the Geological Survey. Sir ARCHIBALD GEIKIE has retired from the service after spending upwards of forty-five years on the work, and if he should ever write his memoirs he will be able to place on record the great change which has taken place in our knowledge of the surface of Great Britain and Ireland. But he will also have to declare that there was no alteration in the spirit of the staff who were so loyal to him, for now, as at first, every surveyor would be willing to join in BEETE JUKES's old song:—

Free o'er the hills our feet shall roam,
We'll breathe the mountain air, sir;
Care shall not ever dare to come,
Nor grief pursue us there, sir.
Joyous in nature's wildest scene,
Where rocks lie topsy-turvey,
And falling waters flash between,
We'll prosecute the survey.
O the survey, the geological survey,
Health and good-humour shall be queen
Of the geological survey!

A joyous spirit is indispensable, for every geological surveyor has to accept the consequences of working under variable climatic conditions. In the last report we learn how the able Mr. BARROW had to retire from field-work after a period of three weeks, that Mr. EGAN died from complications arising from an accident in Ireland, and that Mr. NOLAN has become incapacitated for hill-climbing owing to rheumatism. But in spite of those drawbacks the staff which is now under the direction of Mr. J. J. H. TEALE has been able to perform excellent service. The demands for information on geological subjects have moreover increased at the offices in London, Edinburgh and Dublin. Advice or assistance has been given about building-stones, limestone, coal, sand for glass-making, mining, water-supply, well-sinking, soils, sites for houses, &c. But science demands more than these subjects suggest.

There was a time when the oldest formations were said to be Cambrian and Silurian. It was not always easy to distinguish between them, and many a fierce battle was fought by the followers of MURCHISON and SEDGWICK over the subject. It is now found that the Cambrian is no longer the primitive formation of "the planet's dawning years," for below it there are bedded rocks which the Survey calls pre-Cambrian, but others Ezoic. These ancient rocks have been examined mainly in Scotland, particularly in Ross-shire, where nature was at one time in fierce commotion. At Inchbaye the formation has been intruded upon by porphyritic granite, which appears "to have produced a certain amount of contact alteration in the schists, though this early metamorphism is now masked in part by the structures that have been induced both in granite and schist by the pressure to which they have been alike subjected, and to which in great part, if not wholly, their present crystalline condition is due."

There is evidence of much volcanic action, and minerals which were the results are found in extraordinary quanti-

ties. Thus, in one locality there are exposures several square yards in extent which consist almost entirely of garnet and kyanite, or of garnet and green micaceous scales, in nearly equal proportions. Some garnets are no larger than small shot. It might be supposed that the rocks are all igneous, but signs of bedding are to be discerned, although the indications are only observed in the variations of mica or other minerals. It is also evident that some of the dyke intrusions are of the tertiary age, and therefore comparatively modern to a geologist. It seems incredible that in so remarkable a district there is not more mineral wealth which can be turned to account. Lead ore, it appears, was at one time worked, but owing to the difficulty of carriage the mines had to be abandoned. In another place there was a thin vein of plumbago, from which in 1818 five tons were extracted, of a value of 460*l*.

Later in date is a formation which has been called Dalradian, also in the Highlands, and which manifestly was subjected to terrible convulsions in some remote age. The famous Glen Tilt, a place which at one time aroused general interest from the fact that strangers were prohibited from entering it, is one of the best localities for a study of the phenomena. What is known as contact metamorphism is often exemplified by the tremendous pressure of the underlying granite forcing its way upwards. Limestone bands have been converted into green calcsilicates, while the accompanying black schists pass into cordierite-hornfels, in which the characteristic puckering of these schists can still be detected. The sedimentary rocks are even much impregnated with granitic material. Examples are also seen where the granitic intrusions could not fuse the earlier rock.

The amount of information respecting the Dalradian rocks is surprising, and the observations in the field gain precision by the microscopic examinations to which specimens are subjected. From the descriptions it would be easy to imagine that chaos had come again and that no signs of order were visible. But it has been found that in the area between Glen Salsach and Loch Creran there is an amount of repetition which similar lithological types present. Black or dark slaty schists and quartzose seams are alternately repeated in narrow zones or bands over several miles of ground, in a manner that would completely baffle any attempt at separating the kinds of rock on the map. We have, in fact, says Mr. KYNASTON, a banded series, consisting of repeatedly alternating zones of siliceous and argillaceous material.

The Silurian formation is considered as it appears in Ireland. Many disputes have arisen about the exact position which the rocks should hold in the geological scale. On maps the boundary tracts do not correspond. In 1853 we find JUKES writing:—"A day or two's work in Kildare lately nearly convinces me too of a large Cambrian tract there also, hitherto mapped as Silurian. If not Cambrian it is the very uttermost base of the bottom of the Silurian, or somewhere below that." The early formations in Ireland have been intruded upon by igneous rocks. From Sir A. GEIKIE's experience in the North of Scotland he is able to judge of the characteristics of the invading masses. He has come to the conclusion that the representations of them on the maps will require to be modified. The intrusive masses in Ireland occupy a larger area, and the lavas and tuffs a smaller area than those engraved. But as the revision would occupy several years in the field and the laboratory it is left to futurity. When the time arrives other views may prevail, and meanwhile whatever may be marked Upper or Lower Cambrian or Silurian on a map should be received with caution.

The Devonian formation is another puzzle, and much attention has been given, according to the last report, to what is seen in Cornwall. Some geologists have held that Devonian should not be allowed a separate existence, but treated as synchronous with carboniferous limestone. Mr. HILL, who has examined a large area, found nothing resembling a limestone, and there was an apparent absence of organic remains. He has come to the remarkable conclusion that in some places after the cleavage of the slate beds, but before the cessation of the stresses, mica traps have been intruded, and have altered the character of the beds which came in contact with them. In the old red sandstone the disturbances have also been traced with great

care, in Scotland especially. In one place alteration in the character of the rocks could be seen at a distance of more than a quarter of a mile from the intruding granite.

In the carboniferous area there has been some resurveying. Through Sir A. GEIKIE'S inspiration metamorphic changes have received unusual attention. It has been demonstrated that the succession of strata in Denbighshire and North Staffordshire is nearly identical, and it is concluded that the marls which have been employed extensively near Ruabon and Wrexham for bricks and drain-pipes can also be found in Staffordshire. Mr. GIBSON, one of the surveyors, has ascertained that the marls at Old Hill, used in the manufacture of the famous South Staffordshire blue bricks, are identical in lithological character with the Etruria and Ruabon marls. We may therefore expect to find Messrs. EDWARDS & Co. producing an additional variety of materials for the use of builders. It suggests the latest theory about age in geology when we see that Cornwall granite is introduced in the part of the report which deals with carboniferous rocks. It is, however, worth noting that in the Cornish area there is an almost uniform direction of joint planes, and that the grain of the granite corresponds with the position of the joints. It is believed that the granite is less ancient than the culm, which is probably related to carboniferous rocks.

So many inquiries have been raised about water-bearing formations, care has been taken to investigate the chalk district in the South of England. It is mentioned that slight undulations, such as were overlooked in this homogeneous rock before the divisions were mapped, are now known to form underground water-partings, by raising the hidden impervious beds below; these shed the water in opposite directions and isolate catchment areas formerly thought to be continuous. A thorough knowledge of the limits of these catchment areas is a necessary preliminary to the allotment of the different basins to different towns or districts. Memoirs are in preparation in which the subject will be treated. Meanwhile it is well to know that the raised bands of sand found in some parts of Sussex are the main source of water-supply in the Weald clay district. The water-supply derived from wells in the sands is often tainted with mineral matter in solution, and is usually only sufficient in quantity for household supply, but is important in a district where no other safe source is available. We need not follow the progress of the Survey through more recent formations.

It will be evident to all who consider the subject that the Geological Survey is conducted without any decline in energy or in scientific spirit. The work is, of course, fascinating, and from the circumstance that various theories can be applied in examining strata, an intellectual contest is always going on. DE LA BECHE, LYELL, MURCHISON, RAMSAY, PRESTWICH would acknowledge that the province of the Survey has extended, because, unless it did so, it would be unworthy of the science. Those who consider the duty of surveyors is the preparation of a general map should learn how many important problems cannot be represented on a small scale map. It is by the combination of memoirs, sections and plans, as well as general maps, that the value of the work can be estimated, and on those witnesses the geological surveyors of Great Britain can rely in all appeals to the public.

THE CATHEDRAL OF TOURS.

IN his short story, "Le Curé de Tours," BALZAC was evidently desirous to express the contrast which must exist between an ancient cathedral and one of its ordinary servitors. The church of St. Gatiens is not the most admired architectural work of its class in France; indeed, it must be allowed that as an example of Gothic it has some shortcomings. It possesses a peculiar historical interest, for it gave occasion to a contest between Frenchmen and Englishmen which, if restricted in results and short in duration, was none the less bitter. We may even say without exaggeration that the foundations of Tours Cathedral were laid in blood. A genius like BALZAC could hardly fail, when he thought of the commotions out of which the building arose, to compare them with the petty

troubles and annoyances which made the latter days of one of the priests of the cathedral a torment to himself as well as to others. It was characteristic also of the novelist that over so simple an affair as a curé's furniture politicians should be described as coming into collision. Very few instances can be found in which imagination has so ably combined the colossal and the insignificant in order to invent a tale which could charm a reader for an hour.

It is generally allowed that in old times a French cathedral was only the largest and loftiest part of a series of buildings that seemed to nestle round it for protection. BALZAC supposes that near the cloister at Tours there were several buildings, one of which still remained, and which was traversed by some of the flying buttresses. It originally belonged to the chapter, and during the Revolution had been seized as national property. But somehow a M. GAMARD was able to acquire the old mansion, and he bequeathed it to his daughter, one of those ancient maidens who were so often introduced by BALZAC. As her tenants were priests, the Government at the time of the Restoration did not interfere with her property. One of the apartments remained almost unchanged from its original condition. It was carved and adorned for the reception of one of the dignitaries. When some ancient furniture was placed in it, it seemed a desirable residence for an ecclesiastic. A canon who occupied it was able to fill it with a bookcase, chairs and tables that were suitable, and when he died he left it to his friend the Abbé BIROTTEAU, whose fate through the possession of so much wealth is narrated in the story. Having well furnished rooms, he became discontented with his position as a curé, and desired to attain a canonry in order to be in keeping with the goods around him. Unfortunately he was too simple a man to engage in the diplomacy necessary for success. Eventually he lost his property, and died of the disappointment.

If stones could speak, those of the cathedral of Tours might well utter a satirical discourse over the littleness of men, and especially of ecclesiastics who were ambitious to attain a higher rank in order that they might stand well before their contemporaries. The building has had a history in which the principal actors were men whose character was entirely unlike that of the weak Abbé BIROTTEAU. With Tours is associated the later years of the Roman soldier MARTIN, who divided his cloak with a beggar, an incident which generations of artists have endeavoured to make immortal. The city was also connected with GREGORY, the historian and bishop, to whom we are indebted for all the knowledge we have of the Merovingian kings. The patron whose name is now attached to the cathedral is St. GATIEN or GRATIEN, one of the early missionaries who was subsequently compelled to fly for refuge to Marmoutier, where with his own hands he is said to have excavated a grotto to live in. Afterwards one of the wealthiest of the French abbeys was erected at the spot. The first cathedral or basilica was not, however, placed under his patronage, but under that of St. MAURICE, who was martyred with some companions. The building was destroyed by fire in A.D. 559. A second cathedral was consecrated in A.D. 590 and endured until A.D. 1166. Its destruction was owing to a remarkable event.

Our HENRY II. exercised sovereignty over nearly one-half of France. There was war between him and the French king, but in 1162 a temporary peace was concluded through the intervention of the POPE. Four years afterwards both monarchs were believed to be required in Palestine, but through mutual jealousy they were afraid to depart. An agreement was made that under the circumstances both France and England should contribute towards the expenses of the Crusade. The money was to be deposited in the cathedral of St. Maurice. At the time JOSCEON was archbishop of Tours, and he claimed the right to distribute all the offerings which were received in his cathedral, and to send them to Palestine by his own agents. HENRY II. would not allow of that arrangement, while LOUIS VII. approved of it. Contests took place between the troops of the two kings, Tours was set on fire, and in the conflagration the cathedral was destroyed. Only a small part of the ancient building can now be traced.

With the aid of some of the gold which had been found in the ruins of the cathedral JOSCEON resolved to erect

a new church on a grander scale. Money which had been given for the recovery of the holy places was therefore utilised for the rebuilding of a French church. According to the ethics of that time, there was no injustice in the application of the gifts to a purpose which was not contemplated by the donors. The money was intended to further the interests of the Church, which was one institution, and it was thought to be lawful to apply it at the discretion of the prelates. The first stone was laid in 1170, and the people of that age could have made no objection to the appropriation of the funds, for it is related that the construction was at first carried on with extraordinary ardour. Then followed a reaction, for the work was so slowly conducted it gave rise to a proverb or pithy saying which was applicable whenever an undertaking was a long time in hands, *C'est interminable, c'est l'œuvre de Saint-Maurice*. The building was not finished in the course of four centuries. Like its predecessors it was dedicated to St. MAURICE, but in course of time the name of St. GATIEN was substituted by popular usage rather than by official authority.

There is less known about the architects of the cathedral of Tours than of many others in France. Tradition has not preserved a name of one of them. The building possesses remarkable unity, and it is therefore reasonable to conclude that whenever works were in operation some original plan continued to be respected. The choir and its fifteen chapels are assumed to belong to the thirteenth century. A belfry was erected at the crossing of the nave and transepts in 1377; it was constructed of timber and destroyed by lightning in 1425. A year afterwards the completion of the two towers was undertaken, and during the fifteenth century unusual activity was seen in the works of the building. The cloister of the Psalterie, which will always be connected with BALZAC's story, was erected about that time.

As the two towers are crowned with cupola terminations that were built in the Renaissance period a great many visitors on seeing them allow a prejudice to arise against the cathedral as an example of Gothic. It is, however, a typical instance of the lightest type of French Gothic. The front appears confined in breadth, and there is, perhaps, too much blind arcading and panelling, but although Tours Cathedral may not be so impressive in grave majesty as some of the more northern buildings, it has a charm of its own which is not quickly forgotten. If we remember that a great part of the work belongs to the fifteenth century the character of the details becomes more remarkable. Loyalty to early Gothic is manifest. The builders had no fear of any clashing of coloured light with their masonry, and the stained-glass windows still enhance the interest of the architecture. There are some critics who maintain that the choir is not surpassed in France for beauty. As there is a deviation from the axis in the choir it has been assumed to be an intentional effect, and is symbolic. Although the buildings were not entirely saved from vandalism, the effects are not so visible in Tours as in other cathedrals. The majority of the niches are deprived of their figures, and in consequence the charm of sculpture is not apparent, but as a compensation the sculptured masses which were favoured in Renaissance times, and which marred so many Gothic buildings, cannot disturb the visitor's equanimity. The impression made on the mind is derived from Gothic forms alone, and it must be owned is satisfactory. In no building is the soaring principle of Gothic more manifest than in the cathedral, and especially in the nave. It might be presumed that, in order to increase the effect, the central division was kept rather narrow. All the ornament is delicate in design, and was executed with finesse.

There is much else remaining in Tours which will gratify the lover of antiquity. The ruins of the towers of the abbey of St. Martin recall an institution which rivalled Cluny or St. Gaul as a centre of civilisation. The church exceeded the cathedral in size, for the latter is only about 300 feet in length, and in wealth must have also surpassed it. The abbey suffered at the hands of the Huguenots, and was one of the buildings swept away in the Revolution. There are other churches and some old houses which will enable the visitor to create a picture of Mediæval Tours when it was visited by pilgrims from all parts of Europe.

COMMEMORATIVE CELTIC CROSS.

THE cross we illustrate has been made by the Irish Marble Company, Kilkenny Mills, to the order of Mr. H. C. RICHARDS, K.C., M.P., and is being presented by him to the town of Hastings. It is intended to occupy the position of the old market cross in that town, and to

commemorate the proclamation there of the accession of King EDWARD VII. by the mayor, Alderman F. A. LANGHAM, J.P., on January 26, 1901. The material is Kilkenny grey marble from the Marble Company's quarries, and it is to be erected on a base of local stone, the entire being 14 feet high.

HAMMERED IRONWORK.*

IN the few remarks which I shall address to you on the subject of "Hammered Ironwork," I have borne in mind that I am speaking to those who may have themselves acquired some knowledge not only of the history of art metalwork, but possibly of the practical work of the craftsman, therefore I do not propose to go at great length into the one or the other, but rather lay before you what knowledge I have myself acquired on the subject, with a view that in the discussion which I hope may follow we may be mutually benefited by the interchange of ideas and experiences arising out of our use of hammered ironwork in its various forms.

In touching on this subject I must ask your indulgence if I go over ground which may be more or less familiar to you, and you will certainly require more patience to listen to my explanatory remarks than you will to follow my friend Mr. Ashford's demonstrations, as he will be able to illustrate with a few strokes of his pencil what art metalwork is or ought to be, in a manner which I cannot hope to do in words.

Whenever I watch an art-smith at work I am reminded of the old northern legend of Wieland the smith, who was seized

* A paper read before the Society of Architects on December 19 by Mr. W. Höfler, with demonstrations by Mr. Ashford.

by King Envy and made to forge arms and armour by means of which the king might extend his realm, and as the smith must work unfettered and yet not be able to escape, the tendons of his feet were cut, but the spirit of liberty was so strong within him that necessity taught him how to forge wings for himself, by which means he escaped and took vengeance on his captor.

It seems to me as if every art-smith had imbibed some of Wieland's feelings, and the peculiar poetry in ironwork is no doubt arising from the fact that the worker must, so to say, fight against the stubborn resistance of the material which he has to get under control in order to accomplish his task. It is this supposition, this contrast which exists between the finished work and the violence of the strokes of the hammer by means of which these graceful forms have been produced which give the work its charm. It seems as if the iron were at last to obey with pleasure to the hand which knows how to render it pliable and supple. But it is not sufficient to strike hard to make iron say tender things; it is necessary to strike justly, to act quickly without hesitation, to improvise on the anvil, now with formidable violence, then with caresses. That is why the clever smith almost loves the iron, and it must have been one of these enthusiastic iron-lovers who, in the pride of his craft, said, "If Ceres gave bread to the Cyclops it is only because they had forged her the plough."

The well-known truth that nothing really worth having is ever obtained without difficulties applies with special force to the smith's craft. The more difficult his work the more the clever smith likes it, and the more of his individuality he puts into it. If the works of art in iron of the eleventh to the eighteenth centuries inspire us with so much admiration, it is partly on account of the strong individuality due to the difficulties originating from the very clumsiness and imperfection of the tools which the artists of that period had at their disposal. Just think that when the worker of these past ages wanted a nail he had to forge it himself, and that he had to take a rough bar of iron to produce not only his piece of art metalwork, but often also the very tools with which to do the work.

How often have their patience and their passionate taste been sorely tried by all these material difficulties which might have caused the less audacious to fail in their attempts. All these drawbacks have disappeared in our days. The raw material undergoes transformation which science pursues without interruption. Mechanical tools prepare or finish that which, as I just said, the worker of bygone days had to create himself. Bar-iron, sheet-iron, the various kinds of steel, nails, screws, &c., all are manufactured with a view to the most economical application. I am, of course, far from condemning progress which brings us so many advantages and benefits; but I cannot help saying, and I am sure I am neither too severe nor unjust in saying it, that it is decidedly detrimental to art metalwork in general. It has caused the number of real art metalworkers to diminish sensibly, and the art of the forge is seriously cultivated only by a few amongst them.

For the art-smith's work is indeed a complex and difficult art. It requires of him who practises it a great knowledge of design and decoration, and a special experience which can only be gained in the course of many years. And the artist who has rediscovered the art of the ancients keeps it with jealous care. However, a new era seems now to dawn. The architects in particular, and all men of taste who fully understand the artistic resources of the craft which occupies us, endeavour to allot an increasingly large place to ornamental ironwork in interior and exterior decoration.

I think there is a noble mission to fulfil. On the one hand, to strengthen and support the actual movement in favour of the employment of art metalwork by demonstrating its vast possibilities for rich ornamentation and its numerous applications; on the other hand, to help its renovation and its extension by a short survey of the principal elements of knowledge which are necessary to a good art-smith.

As the native of a country (Austria) where there are so many useful State-aided institutions, I cannot help thinking that in England, too, much good might be done by imitating the example, for instance, of Belgium, where the famous railings in the Place des Sablons, at Brussels, have been ordered by the State, the same being the case with the chancel rails in the Votive Church, Vienna.

It is certain that no smith can be called a good one unless he possesses that artistic intuition, that natural talent with which every art worker ought to be endowed. The boldness, the finish and the beauty of his work are based to a great extent on that inborn skill, that natural cleverness which experience alone, even combined with continuous practice, cannot give to those who do not possess it.

As, however, many great men have held that genius is after all nothing else but the power of steady application to the one object which they had determined to master, much can be done by closely studying the various elements which combine to make up the science of art metalwork. They are the

following:—Designing, knowledge of material and tools, practical skill in the various branches of the smith's work, which are forging, welding, embossing, mounting and finishing.

In speaking of design I do not intend to dwell on the subject of the history of art metalwork, as this would bring me to the almost inexhaustible subject of styles and periods, which has been treated by infinitely more competent speakers and writers than I am. I will only say that the main object in designing wrought ironwork is to obtain a pleasing original effect by means of graceful lines and curves, coupled without practical knowledge of construction, which tends to produce an artistic object with superfluous expenditure. And you will, I hope, agree with me when I say that hardly any other material lends itself so well to absolute freedom of treatment in the interpretation of elegant and yet simple ideas. Even in England, which undoubtedly has taken the lead in sound ideas on artistic taste, the time is not long past when such toy things as imitation roses, spider webs, lizards and many other naturalistic copies in iron found great favour with the so-called "art-loving" public. The much-abused "art nouveau," the "modern style," may have on its conscience a great deal that is unpalatable to the truly æsthetic, but surely it has the invaluable merit of having given the death-blow to all those weak and childish productions. The nineteenth century, with its astounding display of energy, is surely none the less to be respected from an artistic point of view for having endeavoured to endow the future with an art which answers our reformed tastes and requirements, and the origin of this surprisingly sudden movement seems to be found in the complete transformation of the whole machinery of production. The development of mechanical science during the past century has forced us to create certain objects, the want of which had not made itself felt before. But just as in no previous centuries the transformation to entirely new art principles, even under the guiding influence of the greatest reformers, has been quite abrupt, so also now we find in the architecture of the most modern objects many lines which had already previously been employed and which bear witness to the everlasting and real power of all that has been created by the great artists of old. We only wish to discard the pedantic attention to superfluous ornamentation and seek beauty in rational application and treatment of the material.

In my business experience I have noticed with much pleasure that of late years the demand for the so-called "armour-bright" ironwork has greatly increased, because this is the finish which, in the measure in which it leaves visible all the special features of the various processes of hammering, welding, embossing and so forth shows the natural beauties of the material, viz. iron, to best advantage. Black iron stands next for artistic merit, but this black colour, which is obtained either through burning oil on to it or through painting it with "dull Berlin ivory black," is really, like painting iron with various colours or gilding, bronzing it, &c., a makeshift necessitated through the tendency of iron to rust when left unprotected. I have recently heard of a process whereby iron is said to be efficiently protected against rust by means of a metallic coating which in no way changes the natural grey colour of armour-bright iron, and it is sincerely to be hoped that this is not merely the delusion of a sanguine inventor's scheming brain. As regards the architect's position in the matter of designs of art metalwork, I hope you will pardon my saying that I have not found these always quite practical. Junctions are frequently shown where it is impossible for a smith to weld, which induces pinning or rivetting, neither of which are satisfactory to the conscientious smith. One of the great charms of Mediæval ironwork is the utter absence of forced treatment, and it is this which raises the controversy as to who made the designs for these works, the architect or the smith. With all the varied duties and sometimes heavy anxieties which the architect has to bear, I should say that he will very often be glad to leave the task or carrying out the design of the art metalwork in the hands of the specialist.

Let us now proceed to the next section of our programme—knowledge of material.

When you enter the smithy and you see the worker strike the piece of iron, you are put at once before the problem why the piece of iron yields which is to be worked and not the hammer which deals the blow, nor the anvil which receives the blow, all of which appear to be and, as I shall show you, actually are made of the same material. You will say this is not correct; the one is iron and the latter two are steel. Nevertheless both are composed of the same elements, and in both the proportion of these elements is almost identically the same. Steel is nothing but iron, only it contains a higher percentage of carbon. In the latter it is from about 0.05 to 0.6 per cent, in the former 0.6 to about 2.3 per cent. I call your attention to this figure 0.6, common to both, because it shows at once how gradual the transition from one material to the other is. Which, then, are the important distinguishing features between the two? Iron, such as is alone suitable for our work, is soft. It can be

hammered into all shapes, it can be flattened out, it can be swelled by the so-called process of "jumping," it can be bent at very sharp angles without breaking, and it assumes a pasty condition under the influence of great heat. This fact allows of uniting two separate pieces in such a manner that they become practically one, and this process, which is so important for our work, is called welding. When heated, no matter to what degree, and suddenly cooled off in cold water, it does not change its properties perceptibly. Steel on the other hand is hard, breaks when bent at a sharp angle, becomes brittle when heated beyond a light red colour, never assumes a pasty condition, and cannot therefore be welded. Its most remarkable property, however, shows itself when it is heated and then suddenly cooled off. In this case it becomes harder than glass and just as brittle; when still more heated it loses all cohesion, so that small pieces detach under the slightest shock. As you can see, steel in this state would be quite useless for tools, but it can be treated in such a way as to preserve a sharp edge or point even when used with great force on material as hard as iron or ordinary steel. This treatment is called tempering, and it consists in heating the steel to a certain degree which is judged by the colour it gradually assumes in the fire (from crimson to light red), and then suddenly cooling off in cold water. From this brittle condition it must be changed into a state of hardness or elasticity according to the different purposes it is to serve. This is done by slightly reheating the material. It would be very difficult, if not impossible, to determine when the right degree of heating is reached if nature had not provided a most wonderful phenomenon indicating this change; on a polished surface which has to be prepared for the purpose of more easily watching this phenomenon, during the process of reheating appear in succession the following colours:—Straw colour, dark yellow, light brown, dark brown, purple, dark blue, light blue, light grey. Straw colour goes hand in hand with the hardness required for sharp tools which serve for working metal, for instance, punches, chisels, drills—this stage is still rather brittle; the brown colour accompanies the hardness sufficient for sharp woodworking tools or blunt tools destined for treating metal, such as the anvil and the hammer; blue comes into consideration only for articles which must be very pliable—all springs are tempered to that degree. The remaining two colours and the whole range of colours which during further heating fly over the surface in rapid succession are of little interest as the material is approaching its original state.

Having spoken of the material of which the tools are made, I will not detain you with the detailed descriptions of those most used by the smith, but I will merely state that a conscientious smith will avoid as much as possible the aid of mechanical appliances, and confine himself to the use of the patriarchal anvil, hammer and tongs; the swage block, of which I have shown you a specimen, seems, however, to be a permissible addition to the smith's stock-in-trade.

I can now deal with the various operations to be performed by the smith. The first is forging. It is best done when the material is heated to a light red; smaller pieces are forged by one man, larger ones require one or more helpers who then strike in rhythmic succession. Through knocking the piece against the anvil or through a few light strokes of the hammer, the glowing iron is freed from scale which otherwise would be hammered into the piece. If the latter is to become hard and elastic then the forging is to be continued until the piece becomes cold, or hammer and anvil are wetted whereby a smooth surface is obtained. Pieces that have become too hard must be annealed; that is, heated to a dark red and gradually cooled down.

The welding—that is, joining of two separate pieces into one—is done when both are in a white heat. It is important that the smith should know exactly how to prepare his fire in order to heat his pieces; first in the right places, and second to the right degree of heat, because the result depends on these two primary conditions, so that when the moment of welding has arrived he presents to the anvil two pieces of iron which are of the right heat and yet perfectly sound, which means not burnt. At first sight these conditions appear simple enough, and yet more than one smith whom one might ask whether he can guarantee his welding at the first attempt, would at the critical moment, where he introduced his pieces into the fire, reply in the negative. The man is like seized with a fear of all the possible accidents; but this fear instead of diminishing his faculties, gives him, on the contrary, an energy, a dexterity, a precision in the stroke of his hammer which he would certainly not have with sang-froid. For he knows that the welding can generally not be done twice over without seriously compromising the result, may be, of days of difficult and always conscientious work. All these emotions through which he has to pass cause him to become passionate for his craft and to talk of it with pride. The points which the experienced worker will observe in order to prevent failure are the right size and intensity of the fire, which are best regulated by having a sufficient quantity of so-called "breeze" (breeze

is coke from which less gas has been extracted than from ordinary coke, and it is washed three times in order to remove all dust and earthy substance which would cling to the iron and thus spoil the work) handy wherewith to replenish the fire, making it more intense than ordinary coal and allowing the iron to be evenly heated right through without burning it; then he will take care to prevent the blast or draught coming into direct contact with the pieces to be welded, as this would paralyse the action of the fire; he will turn round his iron often enough to protect it from being burnt, and each time he turns it he will sprinkle it with a little sand, which protects the outside of the piece from burning and helps the piece getting evenly heated.

The stretching is synonymous with the lengthening or widening of the piece of iron to be treated. The strokes with the thin end of the hammer are more efficient than those with the broad end.

The jumping is the opposite process and produces a shortening and thickening of the piece. It is done by lifting and then heavily dropping the piece on to the anvil or to a special jumping block, or by striking one end of the piece with a hammer, whereby that portion of the iron which has been made red-hot is swelled.

The adjusting gives to bent pieces or to those which have got out of their angle the right shape. It is done with the hammer on the anvil or on the "adjusting-plate," and can be done hot or cold.

The bending can also be done while the iron is hot or cold. If the piece has to be bent in an angle of 90 degs it is hammered over the sharp-edged beak of the anvil; if it is to be round the circular end of the beak is made use of.

The embossing or repoussé work gives to thin metal all sorts of plastic forms destined to enrich the heavier forged parts. It is done either hot or cold, the latter being preferable for the working of delicate details. Light hammers of a great variety of shapes; either with ball-shaped or edge-like or flat faces, are employed for this work. Great experience is required to judge of the allowance to be made for reducing flat surfaces into curved and hollow shapes.

LIVERPOOL CATHEDRAL.

THERE has just been issued a brochure prepared by "The Liverpool Cathedral petition committee," which has been formed in private, says the *Liverpool Courier*, practically to oppose the present cathedral scheme. The introductory statement, called "a protest," is signed "T. Myddelton Shallcross, hon. secretary pro tem.," and it is dated from 6 Dale Street, but he does not state the names of the committee nor the constituents who selected them. The protest begins by declaring that there is a strong public feeling that the objections advanced against the present scheme have not received from the cathedral committee the consideration which they deserved, and declares the desirability of having the whole project "thoroughly discussed before impartial and unbiassed judges," so "that the views of the opponents of the present scheme may, if sound, prevail, and if not may be finally silenced." He proposes, therefore, a petition against the Bill of which the cathedral committee have given notice, and says, "and to ascertain whether such an inquiry is desired by the subscribers to the Liverpool Cathedral fund, by architects and by the country generally, the Liverpool Cathedral petition committee have been formed and a well-known firm of solicitors retained to advise them." The "protest" goes on:—"The petition committee have sufficient funds to lodge a petition, but they will not do so unless they feel assured of the support of the country generally, by having guaranteed to them sufficient funds to conduct a thoroughly exhaustive and effective inquiry; for they are not wishful to oppose the cathedral committee excepting with a view to insuring that the cathedral to be erected in Liverpool shall be a noble structure and placed upon the best site. The committee, therefore, would be glad to have the views of the subscribers, of architects and of the general public, and an intimation to the honorary secretary as soon as possible as to the amount of contribution which would be guaranteed to the petition committee in the event of their deciding to appeal to Parliament. Although the intimation asked for above is at once necessary, it should be mentioned that, as the lodging of the petition would not be required before about February 1902, the contribution of the cash promised would not be immediately necessary." The pamphlet then argues in favour of Monument Place as better than St. James's Mount, but gives no indication how to raise the enormous amount necessary to purchase that site and the property now upon it, including all business interests which would be affected; and the rest of the booklet consists of a series of extracts from references in newspapers, including letters by the hon. secretary of the petition committee. It would have been much more satisfactory to those whom Mr. Shallcross addresses had he given a list of the members of the committee for whom he speaks, and also stated whether, if the supporters and funds for a petition are forthcoming, he

was advised that a Parliamentary committee would or even could, if it so desired, consider the merits of an alternative site. So much money is required to build a cathedral that to spend any in disputations which would be abortive seems a pity.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held last Friday evening, Mr. R. S. Balfour, hon. secretary, in the chair. Mr. Edward Cooper was elected a member.

The following list of donations to the New Premises Fund was announced, in addition to those already published:—Mr. John Slater, 26*l.* 5*s.*; Mr. A. W. Soames, M.P., 25*l.*; Mr. E. T. Hall, 20*l.*; Mr. W. A. Pite, 10*l.* 10*s.*; the executors of Mr. T. Satchell, 10*l.* 10*s.*; Mr. H. A. Satchell, 10*l.* 10*s.*; Mr. B. T. Batsford, 10*l.* 10*s.*; Mr. Edward M. Gibbs, 10*l.*; Captain W. B. Marling, 10*l.*; Mr. H. B. Creswell, 5*l.* 5*s.*; Mr. G. C. Ashlin, 5*l.* 5*s.*; Mr. W. Woodward, 5*l.* 5*s.*; Hon. A. McGarel Hogg, 5*l.*; Mr. R. H. Weymouth, 3*l.* 3*s.*; Mr. H. Cayley, 2*l.* 10*s.*; Mr. G. L. T. Sharp, 2*l.* 2*s.*; Mr. H. Lovegrove, 2*l.* 2*s.*; Mr. Cole A. Adams, 1*l.* 1*s.*; Mr. S. J. Tatchell, 1*l.* 1*s.*; Mr. E. A. Agutter, 1*l.* 1*s.*

The Chairman said the amount of donations now amounted to 3,183*l.* 17*s.*

Owing to Mr. J. Edwin Forbes (the holder of the travelling studentship of the Association) being unavoidably detained in Birmingham, his paper was read by Mr. J. D. Tate. It dealt with

Oxford.

The author prefaced his remarks by explaining that he had treated this subject in a manner more historical than architectural, because in his opinion, in order to thoroughly appreciate the architecture of Oxford, one must first acquire the atmosphere of the place, its legends, origin and history. Of architectural Oxford so much is familiar to all, and so much has been written and said, that it would be quite unnecessary to repeat facts which are so well known to all interested in architecture. According to Anthony à Wood, "In the building and planting of the city our ancestors have behaved themselves very wisely and politically. They have selected a place among springs and pleasant rivulets. It hath since fallen out that it hath been famous for stone quarries, whereby the city in many ages hath been adorned and beautified, and out of which our colleges have been erected." There is an interesting legend to account for the name of the city. About the middle of the eighth century there lived at Oxford a prince named Didan, whose daughter Frideswyde was a pattern of virtue and piety. Her reputation spread to other countries, and Algar, king of Leycester, came in quest of her hand, but she refused him. Undaunted, he sent some of his servants to carry her away by force, but in answer to Frideswyde's prayer they were all struck blind. The enraged king collected an army,

and was on the point of assaulting the town, when he was deprived of his sight. But Frideswyde had flown from Oxford with two of the nuns to a hovel near the town called Benton. After three years living in retirement she re-entered the city riding on a milk-white ox, to which she constantly called out, "Ox forth, Ox forth," and hence they named the city Oxforth or Oxfull. At the end of the fifteenth century there were twenty-four official money-chests from which the poorer scholars were able to borrow. The lecturer then proceeded to outline a Mediæval student's life from the time when he was taken from his home at the age of eleven by the "fetcher" to his oral examination for bachelor of arts. The Presbyterians and Independents who began to appear in the seventeenth century were far from popular, owing chiefly to their Pharisaical conduct. They would avoid a tavern and ale-house, but yet send for the commodities to their respective chambers, and tipple and smoke till they were overcome. They also showed no respect for any of the old families. In the eighteenth century the coffee-houses were the centres of 'varsity life. There were small libraries attached to each containing books to suit every taste. Christopher Wren acquired at these clubs a reputation as a droll wit. A description of Shelley's rooms was given as typical of those lived in at the beginning of the last century. The custom of taking the furniture at a valuation from the previous tenant was one of the few practices that have come down from the early days, for in spite of the general opinion to the contrary, Oxford now contains in inward management scarcely anything that is old, or which, while retaining an old name or an old place has not lost its original meaning or original appearance altogether. An instance is furnished by the long vacation. In the old days Oxford used to be almost deserted. But now there is no real vacation, or only a short one. Men and dons remain in residence. The life of the undergraduate under the new régime is also greatly changed. In the pre-Reformation days the whole body of Oxford men were like dwellers in one gigantic common room, all members being of a highly exclusive society, and mostly all belonging to one church. Every individual felt himself the member of a little aristocracy, and was conscious of the dignity of his privilege. But now the introduction into the university of quite a new class of men belonging to a lower rank of life has changed the character of the place.

A vote of thanks, proposed by Mr. N. F. Barwell and seconded by Mr. W. J. H. Leverton, was passed to Mr. Forbes and to Mr. J. D. Tate for having read the paper.

The Chairman, in putting the vote to the meeting, said the committee regretted the way in which Mr. Forbes had treated his subject. A paper entitled "Students' Notes" offered good scope for matter, but Mr. Forbes had singularly failed to make his paper interesting from an architectural standpoint.

NOTES AND COMMENTS.

ALTHOUGH the political relations between France and Italy are believed to have been a little strained, there is no doubt that in the exhibition of modern decorative art which is to be held next year at Turin, France is likely to hold the most prominent place. The position assigned to French work, which is in the grand salon, is almost enough to persuade the visitor of French pre-eminence. Several artists have agreed to form a committee to look after the interests of their countrymen. Among them are M. GÉRÔME, the painter and sculptor; M. ROTY, the medallist; M. GALLÉ, sculptor; M. GARDET, president of the section of decorative arts; M. BESNARD, painter; M. LALIQUE, jeweller; and M. DAMPT, sculptor. They will select the works which are to be exhibited, for it has been decided that in the display at Turin the honour of France rather than of individuals must be the first consideration. If England is to take any part in the Turin exhibition it is to be hoped there will be equal care shown in the arrangements. In that case the modern decorative art of England could present a more satisfactory appearance than it has in some late exhibitions.

ENGLAND was not the only country possessing canals which became indifferent to their advantages. In France some of the great canals were disposed of by the State in the belief that they were obsolete. It is now realised that water communication has its use, and should not be sacrificed to railways. Belgium set the example of utilising canals for modern goods traffic. Germany has since followed, and to-day the French are advocating the improvement of canals with their usual energy. It is proposed to expend about 610,000,000 frs. on alterations and improvement of existing canals and new work. The subject will come before the French Parliament early next year. That the financial arrangements will be approved there is little doubt, but what is to be feared is that every deputy will endeavour to obtain a share of the money for the part of the country which he represents. It is believed that the money can be raised without imposing a large addition to the taxation. If the project is realised, it will provide an extraordinary amount of employment for French workmen.

A BROCHURE on "Freehand Drawing of Foliage," by Messrs. JOHN and W. J. CARROLL, has been published by BURNS & OATES, LTD. The plates are reproductions of photographs of plant forms, which appear to have been taken from the living plant, for all seem to have more vitality than is usual in such representations. On each page there are also small diagrams which serve as guides to tyros, who may be puzzled about where they should begin in drawing the examples. The twenty-four plates cost only 1s. 6d., and they can be recommended to designers as well as to students of drawing and painting.

COMPLAINTS are often heard about the destruction of bindings in private libraries, and a common cause is said to be the faulty ventilation and lighting of the rooms. The paper which was read by Dr. PARKER before the Society of Arts, and which we have reprinted, makes it plain that the defects cannot be debited with any reason to architects, but are mainly due to the leather-dressers. Architects' books are generally costly, and they also can claim to be sufferers from the preparers of morocco, calf and roan. It is stated by bookbinders that English leather contains too much sulphuric acid, and in other cases the mischief is ascribed to oxalic acid, especially with the buff calf used in law books. It is not only the cheap leathers which succumb. In the British Museum, where great care is taken with bindings, it has been found that some fail after ten years' use. It would have been well if more attention had been given to foreign leathers in the discussion at the Society of Arts. Books bound in France and Belgium do not fail so quickly as those which are bound in England. The leather may appear to be lighter in weight, but it somehow withstands the conditions in England better than native work. Light roan also often outlasts morocco. It is also remarkable that imitation tree-calf made of paper in Germany and pasted on canvas has been found more enduring than genuine English binding in that variety of leather.

ACCORDING to COWPER, it is pleasant to look at the world through the loopholes of retreat, and a survey of that kind has inspired the thoughtful book "In a Minster Garden: a Causerie," by the Dean of ELY (London: ELLIOT STOCK). The pages were written, for the most part, during convalescence. Dr. STUBBS looks on himself as the successor of Prior JOHN of Crauden, who lived at Ely in the beginning of the fourteenth century, and who was likely to have discussed VITRUVIUS with the sacrist, ALAN DE WALSINGHAM. The Dean also loves architecture, and indeed a man would not be worthy to have control of the beautiful cathedral unless he possessed more than an official respect for building. The description that he gives, by the agency of a correspondent, of the octagon of Ely by moonlight, is enough to prove his right to be regarded as an amateur, and there is much else which will confirm that opinion. The Mediaevalism of Ely comes out the stronger from the contrast between it and impressions which were derived from a visit to America. Another charm of the book is that amidst so much that relates to the past there is an indication that love is still lord of all, for there is a suggestion of a modern romance in the pages. It can be said of Dean STUBBS'S "Causerie" that it is worthy to be placed on the same shelf with SOUTHEY'S "Doctor." But the latter delightful work never possessed illustrations, while there are fourteen views of gardens and architectural works as embellishments of the Dean's chapters. No book of this season is better adapted to serve as a Christmas present.

VISITORS to the Salon in the Palais de l'Industrie, and architects more than any other class, often expressed surprise at the meanness of the staircase which led from the department of sculpture to that of painting. Efforts were sometimes made to conceal its deficiencies by means of tapestry, which could easily be obtained without payment for the sake of advertisement, but the original defects could not be overcome. The staircase was constructed in 1855 for temporary use, for it was expected that money would be forthcoming which would enable one to be carried out which would not be unsuitable for an exhibition of modern French art. But for over forty years the temporary structure was allowed to remain, and the representatives of the original contractor were paid over 200% a year for the use of it. The old Palais de l'Industrie has been annihilated, but its successor, the Grand Palais, seems to be destined to resemble its predecessor in its staircases. M. DEGLANS, one of the architects, designed two fine staircases, but there is no money to pay for their construction. It has therefore been decided to use a temporary staircase of wood. How long it will have to stay cannot be determined. The Government have not the money to spare, and the two societies of artists who exhibit in the Grand Palais are likely to remember how much money they have already lost over building works. In any case expedition is demanded, for a great many French artists are of opinion that the Grand Palais cannot be ready for the reception of works at the beginning of April, and they believe it would be an advantage if the Salon exhibition was not held in 1902.

ILLUSTRATIONS.

CHURCH OF ST. JAMES THE GREAT, LEICESTER.
DETAILS OF FAIENCE WORK.

THE contract for the portion now built, consisting of a chancel, choir and four bays of nave, is 7,899/- Two additional bays with baptistery, narthex and west end will complete the church, which will then accommodate 1,000. The church is of the basilica type with raised choir projecting into the body of the building. Under the choir and apse are convenient parish-room and classrooms. The materials are Woodville bricks, Mansfield stone and Devonshire marble columns, terra-cotta arcading, pulpit and choir, with faience panels to choir and apse (the latter not yet fixed). Messrs. H. HERBERT & Sons, of Leicester, are the contractors, and the terra-cotta is by the Burmantofts Branch of the Leeds Fireclay Company.

THE NEW READING ROOMS, LEICESTER.

IN this building also it will be observed from the illustration that the work of the Burmantofts Branch of the Leeds Fireclay Company is also largely introduced.

BATHS, CHESHIRE STREET, BETHNAL GREEN, E.

LEATHER FOR BOOKBINDING.*

FOR many years past there has existed a growing dissatisfaction among librarians and owners of libraries with the quality of the leather put on books, owing to the fact that many books bound within comparatively recent years already show serious signs of deterioration and decay. This dissatisfaction grew in volume until a small committee of gentlemen interested in the subject, called together by Mr. Douglas Cockerell under the chairmanship of Mr. Cobden Sanderson, began to investigate some of the causes, and to take evidence on the subject. At this committee a certain amount of information was gleaned, but it was found generally that the exact causes of the decay were not known. Librarians were inclined to lay a good deal of the blame upon the bookbinder, who in turn blamed the leather merchant for the quality of the leather, and the leather merchant when questioned absolved himself of all blame by vaguely talking of new processes of tanning, even hinting as to the existence of some rapid process of transforming skin into leather by aid of acids and other chemicals.

After this, which I may term a preliminary inquiry, the Society of Arts took the matter up, determined that it possible the cause of the dissatisfaction should be investigated. To this end a very strong committee was appointed, under the chairmanship of Lord Cobham, and the members included representative bookbinders, librarians, leather merchants, leather manufacturers and chemists, who made a special study of the leather trade. Of this committee I formed a humble member, and as a member of both sub-committees which were subsequently formed, as well as of the main committee, I have been asked by several to detail the various investigations which were carried out by the sub-committees, to show samples of the leather which was used and tested, and to give the actual proof and experimental work in detail on which the main committee based its report, which has now been before the public for some months.

I need hardly enlarge upon the work of the first sub-committee whose object was to justify the cause of the complaint, to find out which leathers appeared to decay most rapidly, and the conditions under which the books were kept, whether the decay was noticed as much in libraries lighted with gas or electric light, whether the bindings appeared to last longer when kept under glass cases, and if possible to note approximately the period at which general decay seemed to set in. This committee in its work visited nine of the most valuable and most important libraries in England, and found generally that most modern leather of all kinds showed signs of decay, and in many cases that bindings of not more than ten years already showed marked signs of deterioration and decay. The bindings of scientific works, proceedings of learned societies, on shelves, bound in calf, of which the date of binding could be very closely ascertained, were in many cases falling to pieces, and in several cases books bearing the dates of 1885, 1886 and 1887 could not be handled without the leather coming off in the form of dust. In another case the removal of the book from the shelf caused the back to come right off.

Generally speaking, as the report clearly states, most sign of decay was found in libraries where gas was used for lighting; and it was also found that, approximately, the most marked form of decay was noticed from 1860 onwards. It was certainly noticeable on books bound at any earlier period, but it became more general, comparing all libraries, about 1860.

Through the extreme kindness of several of the librarians and bookbinders I was allowed to detach portions of many of the worst specimens, in order that they might be laid before the second sub-committee for microscopical and chemical examination. This second sub-committee was also supplied with many old bindings and with various samples of bindings, the exact date, nature of the leather and all particulars being clearly stated.

Turning now to the work of this second or scientific sub-committee, the problems before them were therefore of a definite nature. Having first convinced themselves of the almost universal tendency on the part of modern leather to decay, their work was to investigate the cause or causes of this modern decay, and to find out why books which were bound in the fifteenth to the early part of the nineteenth century were still in most cases in almost perfect condition. It was extremely unlikely that any change had taken place in the nature of the raw skins used. It was consequently taken for granted that the causes were to be found in some of the modern processes of leather manufacture. An examination of several pieces of old bindings revealed the fact that the bindings were, generally speaking, thicker than those of more modern date. A microscopical examination showed the fibres of these leathers to be in an upright condition, whereas in more modern leather this is not generally the case; the

stretching and tight setting-out of the skin having a tendency to lay the fibres in a more parallel state. Another important factor was revealed by the chemical analysis, which showed that all the old samples of leather analysed contained less tannin in proportion to the skin substance than was found in more modern bookbinding leather; in other words, it was evidently the custom in the eighteenth and nineteenth centuries to tan the skins in weaker liquors, with the result that the leather was lighter tanned than is the custom at the present time.

Further, and also another important factor was, that in most of the bindings examined which had stood the test of time the tanning material which had been used was in nearly every case either sumach or oak bark, and it was further noticed that in many cases where even fairly modern leather had stood for twenty or twenty-five years the tanning agent had been sumach. Here, therefore, there was indicated a special line of investigation likely to be productive of much useful information. Although sumach and oak bark are still used for the tanning of the better-class high-priced leather, very many skins are tanned with such materials as quebracho (a wood which comes from South America), larch bark, gambier and mimosa bark, and thousands of dozens of sheep, goat and calf skins are sent over ready tanned from India. These latter are tanned with turwar bark, Cassia auriculata. These are known in the trade as Persian moroccos, Persian sheep and E.I. calf. Some of these skins are simply scoured, dyed and finished, while the majority are stripped of the loose tannin by scouring in a weak alkaline bath, borax or carbonate of soda being used. As this treatment turns the skins an ugly dark brown colour they are put into a bath of weak sulphuric acid. When supposed to be thoroughly freed from sulphuric acid by washing in water, they are retanned with sumach, and afterwards dyed and finished in the usual manner.

In order to find out whether any special tanning material had or had not an advantage, and whether the tanning material, per se, was liable to cause decay or destruction of the leather, calf, goat and sheep skins were tanned out, one of each skin in each of the following tanning materials: pure sumach, pistacia lentiscus, tamarix, oak bark, myrobalanus, quebracho, mimosa bark, gambier, larch bark, chestnut extract and oak-wood extract. Two sets East India tanned goat, sheep and calf, one set washed, oiled and dried, the other set scoured, soured & sweetened and retanned in sumach as carried out in practice, were also prepared. When these skins were judged to be lightly but thoroughly tanned, one-half of each skin was removed from the tan liquor, and the remaining halves were left in the liquors, these being strengthened up with more tannin, so that the second halves were more fully tanned, as is most commonly the case in modern leather. The leathers so produced were rinsed through water to remove superfluous tan, allowed to drip, and when in a semi-dry condition were oiled lightly upon the grain surface and hung up and dried in the usual manner. Portions of these skins are before you on the table. Pieces of each of these leathers were so fastened upon boards that one-half of the piece of leather was exposed, while the other part was carefully covered, so as to be protected from either light, heat or the action of the surrounding atmosphere. In all, eight such duplicate sets were arranged, and were subjected to the following tests for thirty days:—

Board No. 1 was exposed to an ordinary direct sunlight. This was done in a large room facing south, and the tests were carried out during July and August.

The second board was exposed to the action of gaslight. A small cupboard was arranged, and a No. 5 ordinary fish-tail gas-burner was placed in the centre of the cupboard, and the boards so arranged round this that the leathers were about 18 inches from the lighted burner.

No. 3 board was arranged in a similar cupboard and exposed to the light from an ordinary incandescent gas-burner.

No. 4 was also arranged in the same way, but in place of the gas-burner a 16 candle-power incandescent electric lamp was used.

The fifth board was subjected to the fumes of burnt gas. To carry out this experiment a similar room was used 8 feet high and 6 feet square. On the floor of this room was placed an ordinary fish-tail burner, turned about half on, and the boards, with the leather fixed upon them, were hung on the ceiling. A maximum and minimum thermometer was also hung on the ceiling, and the room so ventilated that the temperature was not allowed to exceed 90 deg. Fahr. I may add that this was the temperature noted on the top shelves of two of the libraries which were examined, so in this case the worst library conditions were imitated as closely as possible.

The sixth board was subjected to moist and dry air alternately. This was done by drawing a current of moist and dry air over the leather through a vacuum oven. The temperature was kept at 60 to 70 deg. Fahr.

The seventh board was subjected to an atmosphere of carbonic acid gas. This test was likewise carried out in an

* A paper read by Dr. J. Gordon Parker before the Society of Arts on November 27.

oven, the carbonic acid gas being dried before it was allowed to enter the bath.

The eighth board was subjected to direct sunlight, but the leather was protected from the air by a sheet of glass being laid upon it. This was exposed at the same time, and in the same room as board No. 1.

The leather after this treatment gave some most interesting and instructive results. It showed:—

1. That the leathers tanned with certain tanning materials were less affected than those tanned with other materials.

2. That the fumes of burnt gas appeared to act more strongly on all the leathers than any other agent.

3. That artificial light had only a slight effect upon the leather, provided it was protected from the products of combustion.

4. That direct sunlight and air appeared to have a very strong disintegrating action upon most of the samples, but when the leather was protected by a covering of glass the action was less intense.

5. Moist and dry air appeared to have no special deteriorating action. The same thing was noticed in the set exposed to carbonic acid gas. The electric incandescent light appeared to have even less effect than either ordinary gas-light or the incandescent gas-burner, probably on account of the less heat evolved and the absence of products of combustion.

On examining all these sets side by side it was noticed that in each case the leathers tanned with sumach were the least affected of any, followed in regular rotation as being less affected by myrobalanus, chestnut extract, oakwood extract, oak bark, gambler, larch bark, quebracho, pistacia and tamarix; and the worst set was the leather tanned with turwar bark, especially the sample which had been scoured, soured and retanned. Further, it was also noted that the samples of leather which had been only lightly tanned were less affected in each case than the samples which had been finished in stronger tanning material, and were thus more heavily tanned. These results showed that the tannins which belong to the pyrogallol class of tanning materials, viz. sumach, myrobalanus, chestnut and oakwood extracts, were the least affected; while, on the other hand, those of the catechol series, represented by gambler, larch bark, quebracho and turwar bark became dark red in colour and hard in texture. The fibres of the leather appeared to be disintegrated, and in the worst cases the leather could not be rubbed even with a soft cloth without removing a layer of red powder. The tannins of the catechol series appear to part readily with water when exposed to the action of light, heat, or acids, and are converted into red, resinous-like substances which appear to thoroughly disintegrate the fibres of the leather, causing it to become hard and lose all strength.

These above detailed experiments were first carried out at Wrexham by Mr. A. Seymour-Jones, and were afterwards repeated by myself in London, and both sets were confirmed by Professor Procter in Leeds, so as to leave no doubt about the accuracy of the work. A similar set was treated for sixty days, and some leathers were exposed for three full months. These samples are before you this evening, and can be examined by anyone interested. This was the first stage of the work, and it revealed clearly that tanned goods of which sumach was the tanning material were the least affected of all the tanning materials, and that the East India tanned portions were the most sensitive to either gas fumes, light or heat.

To further test these latter goods, a fresh set of leathers was obtained. An ordinary tanned East India goat and also a sheep skin were purchased in the usual manner, and each skin divided into four parts. A quarter of each was left in its state as purchased; a second quarter was rinsed through water, lightly pressed out, oiled and dried; a third quarter was scoured in alkali, then washed through sulphuric acid, afterwards well rinsed in water and then retanned in sumach; and the fourth quarter was simply washed well in water, struck out, and afterwards retanned in sumach. These portions of skins were subjected to a similar series of experiments, to the action of gas fumes, direct sunlight, and to diffused daylight for sixty days. Each sample was more or less affected. The quarters which had been stripped with alkali, treated with acid, and afterwards sumached showed most deterioration. The portions exposed to the action of burnt gas fumes were absolutely rotten at the end of the time, and could not be handled without breaking or falling into powder. The best sample was that which had been simply washed in water, oiled and dried, but even this was badly damaged and turned a deep red colour, but it showed that the removal of some of the tannin tended to lengthen the life of the leather; while, on the other hand, the usual trade custom of stripping with an alkali and souring with acid, afterwards retanning in sumach, appeared to about halve the already short wearing life of these leathers.

Thus far, then, the committee had discovered the best and the worst leather in its natural tanned state. The next point was, if possible, to find out the cause of the decay in modern

oak-barked tan calf. For this purpose several samples of tanned calf skins were purchased and obtained from librarians and bookbinders. None of this leather had been used or exposed in libraries, and most of the samples contained varying quantities of free sulphuric acid, which had evidently been used to brighten the colour. Several other samples were therefore obtained, free from sulphuric acid. Portions of each of these skins were subjected to the method of testing described, with the result that acid-free leather stood the tests in a very satisfactory manner, while the other samples which contained quantities of sulphuric acid, varying from two-tenths to eight-tenths of a per cent., had changed to a red brown colour, become hard and brittle and were easily abraded by friction.

I may say, in passing, that this custom of brightening the colour of bark tanned calf with acid is of comparatively recent date, probably becoming general twenty or thirty years ago. It has a wonderful effect upon the leather; it removes stains or any unevenness in colour, generally brightening the somewhat reddish tone, and transforming it into one of a yellower shade, thus giving to the skin a better appearance from the buyer's standpoint. Further tests with bark tanned calf showed that the heavier it was tanned the more rapidly it appeared to decay.

The experiments carried out thus far, as will be noticed, were only done with the rough-tanned skins. But it was necessary to find out whether the methods of dyeing and finishing leather in any way impaired its wearing qualities. For this purpose several kinds of skins, including calf, sheep, goat, seal and pig, were obtained, and each skin was divided into four portions. The first portion was retained in its rough tanned state; the second portion was struck out, dyed, freed from superfluous dye by rinsing in water and dried out; the third portion was struck out, dyed and finished in the usual manner, being glazed after applying an ordinary albumen seasoning, and no acid being added to the dye-bath to develop the colour; the fourth portion was struck out, dyed with the addition of an ordinary amount of sulphuric acid, and finished in the usual manner. These series were, as before, exposed to direct sunlight and to the fumes of burnt gas. The results showed at once that the dyeing of the leather where no acid had been used did not in any way affect the life of the leather. The finishing appeared to protect the surface of the leather somewhat. This would, of course, be expected, as the ordinary finishing process consists of coating the leather over with a thin layer of albumen, and afterwards polishing either by hand or machine. This thin layer would naturally protect the tannin from oxidation and preserve the leather for a certain time. The portions of the skins with which acid had been used in the dye-bath, however, showed signs of decay, and had become hard and brittle. Of the five different skins used, the calf and sheep appeared to be the weakest, while the goat, seal and pig skins appeared the least affected of the five.

In order to ascertain whether the use of sulphuric acid, either as a brightening agent or in the dye-bath, had become universal, from various sources we collected a large number of samples of different kinds of leathers. I have not the details of the number of samples examined by Professor Procter, who fully confirms my results, but I personally analysed thirty-eight different samples of moroccos, and found that thirty-six contained free sulphuric acid; eighteen different samples of skivers were examined, of which twelve contained acid; thirty-two different samples of calf, out of which twenty-seven contained free sulphuric acid; eighteen Persian goat and twenty-three Persian sheep were also examined, and in all cases free sulphuric acid was found to be present. Six different samples of pig-skin were all tested, and in each of the six free acid was found. These were all of English manufacture, some obtained direct from the manufacturers, others from leather merchants and bookbinders.

Knowing that of recent years a large quantity of French and German skins had been used for binding purposes, eight different samples of French Levant moroccos were obtained, and in each of the eight samples a large quantity of free sulphuric acid was found; the lowest contained six-tenths and the highest 1.3 of acid. Twelve samples of German book-binding leather were in like manner tested, and eleven found to contain acid. The highest percentage found in any was .85 per cent.

It would, perhaps, be unfair to draw a definite conclusion from the few French and German skins examined, but those which passed through our hands were certainly much inferior from the bookbinder's standpoint to any of the English skins. Although the French skins were of a bolder grain and larger in area, they were split down to such an extent that they were little better than paper, added to which a higher percentage of acid was found in this class of goods than in any of the English samples.

It is evident, therefore, that sulphuric acid is of almost universal use, either as a brightening agent or to liberate the dye in the dye-bath.

As it is always customary in tanyards to rinse the skins well through water after souring with acid, it was somewhat surprising to find such a high percentage of free acid still present in the finished leather. Tests were therefore undertaken to ascertain the amount of washing or rinsing necessary to remove the acid. To this end several pieces of skin were treated with known quantities of sulphuric acid, and then washed for varying periods in running water. It was found to be practically impossible to remove the whole of the acid by rinsing or washing in ordinary water. One piece of "Persian" leather, containing 1 per cent of sulphuric acid, was washed for five days and nights in running water, and at the end of that period it was found that it still contained slightly over two-tenths of a per cent. of sulphuric acid, showing that sulphuric acid, as stated in Professor Procter's Cantor Lecture, delivered before this Society, appears to dissolve in the leather and adheres most tenaciously to the fibres. It was, however, found that if skins were washed in water containing either potassium or sodium lactate or acetate, the free sulphuric acid was neutralised; where, therefore, it is absolutely necessary to use sulphuric acid, the committee recommend that this means of neutralisation be adopted.

The committee then turned their attention to the various processes of tanning. Without wearying you with all the details of the experiments made, I will merely state that it was found in general that skins which had come from abroad preserved in salt were when tanned weaker in texture than either dried or fresh skins. Skins which were in any way tainted, or even only slightly decomposed, were extremely weak.

Many sheep skins arrive in this country from New Zealand and Australia in what is known as the pickled condition. These skins are pickled in a solution of salt and sulphuric acid. Several of these skins were tanned and compared against unpickled skins, and it was found that the leather produced from skins which had been pickled was much inferior in strength and durability to the unpickled.

Low liming and the use of stale limes containing quantities of free ammonia were found to weaken the pelt, as also over-puering, a process which is used to rid the skin of lime, and, at the same time, to pull down its thickness, and to make it soft and pliable.

Many of the finished leathers examined microscopically by us showed that the skins had been distinctly over-puered. This was very noticeable in a series of pig-skin bindings of one of the large public libraries.

Another interesting feature, already referred to, was that leather appeared to lose in strength and durability the more heavily it was tanned, and this point is one which leather manufacturers should watch. I am of opinion, as expressed in the report, that the skin for bookbinding purposes should be lightly but thoroughly tanned; not what would be termed "dead tanned." They should then be rinsed lightly through water, should not be tightly set out and should not be dried in a stretched condition. It is the custom to dry many kinds of leather strained tightly over boards. This tends to lay the fibres in a flatter and more parallel condition, and to keep the fibres all taut, removing from the skin its elasticity and also what I may term the cushion effect which is produced when the fibres run transversely to the skin.

Many of the different samples examined, both on and off books, were found to be shaved down or split so that only the thin grain surface remained. It required no investigation to prove that this was contrary to all reason, and that shaving the skin down to the thin substance could not but reduce the leather to about the level of brown paper as a binding agent.

Mr. Douglas Cockerell was good enough to obtain for me from different sources sets of samples of six different substitutes for leather for bookbinding purposes. It would be better for me on this occasion not to mention the names of these substitutes, although they are all well known to bookbinders. These mostly consisted of cloth or cotton foundations, covered over with some material of a waterproof nature, which by skilful processes could be made to imitate almost any class of skin. These samples were each subjected to a series of tests similar to those that the leathers had undergone, and although sunlight or artificial light appeared to have little or no effect upon these substitutes, they were more easily affected by the fumes of burnt gas than even the poorest qualities of leather. Moreover, in a dry atmosphere they become hard and somewhat brittle.

Examination was next made of some of the methods used by bookbinders for brightening the leather and for sprinkling, and also of the pastes which were employed by them in their workshops. To this end the committee were willingly supplied by various binders with samples of sprinkled leathers and dried calf, also samples of leather which had been washed with oxalic acid to brighten the colour. It was found that sprinkled leather soon went into holes, and leather which had been washed with oxalic acid also rapidly darkened in colour, and became very hard and brittle when exposed to the sun's rays.

The pastes on the whole were found to be harmless,

but from the leather standpoint we cannot too strongly emphasise the damage which must be caused to the leather by stretching it out too tightly over the back of the book in binding.

Before concluding this somewhat lengthy account of the different series of experiments carried out, I would point out one fact which at first was somewhat puzzling. We found that sumach-tanned leathers in every case stood all the tests better than any other, but that some samples of sumach-tanned leathers deteriorated, while others showed no sign after even sixty days of sunlight. On examining carefully the leathers referred to it was found that some of the rough-tanned sumach skivers contained free sulphuric acid. As the source of supply in two cases was known, the firms in question were written to, and it was acknowledged that a small quantity of sulphuric acid had been put in the sumach tanning vats to give the skins a slightly thicker feel.

But another cause for the differences in sumach-tanned leather is the fact that cheap brands of sumach are invariably adulterated with the leaves of two other materials, viz. pistacia and tamarix, and it was the presence of these adulterants which caused some of the sumach-tanned leathers to show deterioration. This discovery led us to tan out skins with tamarix and pistacia in order to see how they behaved in comparison with sumach tannage, and as the first series of experiments showed, they were considerably worse than even larch or gambier-tanned skins.

It was our duty to give if possible some advice to librarians and others as to the preservation of books bound in leather, and Professor Procter undertook an elaborate series of experiments with glasses of various tints in order to find out whether the disintegrating effect of sunlight could be minimised by the use of lightly-tinted glasses. His experiments were eminently satisfactory. He found that the violet or actinic rays which affected photographic printing paper also affected the leather, so that any glass which would keep out the actinic rays could be recommended for the glazing of library windows.

I have endeavoured to state as clearly as possible the details of the chief experiments which were carried out by us in order that the leather trade may be able to judge whether the grounds on which the report is based are sufficiently strong. Many other experiments were done, but I will not lengthen this paper by detailing them, as they were of lesser importance than the ones I have given. I need only say that every statement and recommendation made in the report, the grounds for those statements, and the experimental and practical work on which they are based, were confirmed by each individual member of the sub-committee, so that their conclusions cannot, as has been stated by some critics, be considered as being simply the "opinions or fads of professional men."

Before bringing this paper to a conclusion, I should like to refer to a fact that impressed us very forcibly, viz. the number of disguises under which the ordinary sheep skin masqueraded. We found books bound, nominally, in levant morocco, hard-grain morocco, straight-grain morocco, pig-skin, calf-skin, crocodile and alligator leathers, which leathers, on close microscopic examination, were found to be the ordinary common sheep skin, on which had been stamped, probably by electrotype rollers, the special grains and markings of the skins they were got up to imitate. In many cases both the bookbinders and the librarians had bought these leathers under the impression that they were buying the genuine article, the buyers having probably been tempted by the low price which would naturally be charged in a case of this sort.

The question of price brings us, I think, to one of the most important points in connection with this investigation. I may be wrong, and it may be that I am not sufficiently connected with the commercial side of the leather trade to form a definite opinion, but I venture to give my views on the subject for what they are worth. I believe that a good deal of the leather of the cheaper sort which has been found to decay is largely the fault of its cheapness. The librarian has stipulated that his books must be bound at a certain contract price. The bookbinder has in consequence to procure a cheap class of leather. This he has in most cases easily found, as there is always a large quantity of cheap leather on the market, splendidly finished, and to all appearances of first-class quality, which owes its high finish and good appearance to the use of materials in manufacture which are injurious to its strength. I think it is therefore clearly the duty of the librarians, if they are determined to have a leather which will last, to put in their specifications, when high-class work is required, that the leather must be of pure sumach tannage; secondly, that no mineral acids must have been used in any process connected with the manufacture of the leather; and thirdly—also an important point—that the skins used must not have been pared down or split to paper thickness. For small books, small and thinner skins must be used in the binding.

Sumach-tanned calf can be obtained and can be dyed to the brown shade so much liked in the case of ordinary brown calf; bark-tanned calf can also be used in binding, pro-

vided the leather is not over-tanned, and has not been brightened by the use of acid; but I think there is not the slightest doubt the librarians must in future, if they wish a leather to last more than from ten to fifteen years, insist on their specifications being carried out to the letter, and they must be prepared to pay a correspondingly higher price for a guaranteed article. Low quotations in most cases are to be regarded with suspicion. Chemists have now obtained sufficient knowledge to be able to test leather both chemically and microscopically. (1) for the presence or otherwise of acids; (2) to ascertain if the leather is over-tanned; (3) the tanning material used, and (4) to ascertain whether the fibres are in a good healthy condition, or whether the skin has been damaged, either in the early liming or puering, or in the later finishing processes.

I believe that in many cases the manufacturers themselves are not wholly responsible for their leather being spoilt. The buyers often demand high finishes, bold grains and other characteristics in the leather, such as can only be obtained at the expense of its strength and durability. In many works the finishers use both alkalies and acids at different stages to produce certain results, and in nine cases out of ten they do not understand the action of the materials, and do not know that their use damages the leather. It seems to me that it would not have been necessary for this committee to sit, and for its members to spend so much time and trouble on this investigation, had the workmen, or, more important still, the leather manufacturers themselves, possessed greater knowledge of the principles underlying leather manufacture.

The work of the committee is not yet completed, as the question of the fastness of different dyes is still under investigation. The committee hope that this part of their work will be finished by next summer.

BLOXHAM CHURCH.*

THE church of St. Mary at Bloxham consists of a chancel, clerestoried nave with north and south aisles, a chapel on the south-east of the south aisle, a western tower projecting beyond the aisles with octagonal spire over, and north and south porches. The east end of the north aisle is so divided as to form a transept. The south porch is groined and has two rooms over it.

Of the church as it stands to-day the arcades between the north and south aisles are the oldest parts of the building. They are of four bays each, and belong to the Early English period. On the north the columns and all the members of the moulded capitals and bases are circular. The south arcade is very characteristic of Early English work, and suggests a somewhat later date than that on the north, probably about 1220; the columns are composed of a circular shaft with four smaller circles attached, the mouldings of the capitals and bases following the same shape. One of the capitals has its bell richly ornamented with stiff-stalk foliage, two have perfectly plain bells, whilst one is ornamented with four trefoil leaves. The arches of both arcades are pointed and are of two orders, with chamfered edges. The chancel, tower and spire, with the majority of the windows, belong to the Decorated period.

The tower is composed of five stages; the fifth is octagonal forming the junction between tower and spire; two unusually large buttresses, ornamented with canopied niches, and having copies of human figures for their termination, strengthen the angles of the western face of the tower; at the junction of the square with the octagonal stage rise four tall pinnacles, which, with their crocketed finials, come far above the base of the spire. The lower of the two windows, which are on the western face of the tower, is of three lights, with the heads of the lights elevated so as to reach up to the main arch; the hoodmould is decorated with the ball flower. The upper window has two lights, each of which is entirely surrounded by ball flower; the two lights are coupled together, with a space of plain wall between them, where is a canopied niche; the three compartments have independent hoodmoulds which, however, are joined and capped in the centre by a fleur-de-lis ornament. This is sometimes called a twin window; there is one at Irthlingborough, Northants (date c. 1350). From this window the eye is led on to the culmination of the ornament in the richly decorated bands which surround the octagonal stage of the tower, and these, together with the graceful pinnacles, form a rich and attractive mass of ornament, which gradually dies away through the window and crockets of the spire to its termination 195 feet above the ground. The spire is one of the fine series of Oxfordshire steeples (the term applies to the style and not strictly to the county) which, with their angle buttresses, traceried parapets and enriched gable-lights, were in direct descent from the early spire of St. Frideswide's, at

Oxford. Witney followed shortly, and of later date we have Shipley, Bampton, Adderbury, Bloxham and King's Sutton. The typical characteristic of this class of spire is the manner in which the pinnacles are brought within the angle of the tower close into the octagonal sides instead of being kept independent at the angle of the tower.

The west doorway is large and curiously decorated. It is adorned with a sculptured representation of the Last Judgment, wrought on the wall above and on each side of the door arch. The north doorway has its capitals and archmoulds decorated with foliage and ball flower; the jamb moulding is formed by a combination of circular and fileted shafts and the wave moulding. The south doorway arrests attention and will be referred to later; its mouldings are elaborately decorated with zigzag ornament of the Norman period.

The parapets of the nave and north aisle are decorated with panelling, and on the cornice beneath the parapet of the north aisle is carved a curious series of grotesque figures. A good specimen of the sanctus bell turret remains in its usual position at the eastern end of the nave.

The greater part of the window tracery belongs to the Decorated period, and is of an unusually varied and interesting character. There are five windows in the chancel; the eastern and three others have had the tracery replaced by modern work. In the remaining two the mullions simply cross and continue into the window-head; some Norman mouldings with beak-heads, billets, &c., are built into the jambs of these windows in a manner that at a glance might be somewhat puzzling. A small low side window (2 feet 6 inches by 1 foot 2 inches) remains at the west end of the south wall. In the aisles there are six windows with tracery belonging to the Decorated period. Only two of these are alike; they have three lights, above which is an arrangement of cusped circles. One has the ornament entirely formed by ogees; the other three contain tracery of a peculiarly interesting and attractive type. The east end of the north aisle forms a transept, the north wall projecting somewhat beyond the face of the aisle wall; across the aisle are two pointed arches supported on a slender column which has a peculiar capital. It has been rescued by care and patience from a mass of whitewash under which it was once entirely hidden. It is supposed to represent the head of St. George enveloped in the coiffe de mailles as worn in the reign of Edward I. In his left hand is his shield and in his right his gonfanon, both charged with his appropriate emblem; around the other parts of the capital are heads similarly attired. The base of the columns has masks at the corner. The marks of a pointed roof over the nave can still be seen over the chancel arch and against the tower; this was removed for the addition of a clerestory which is well lighted on both sides by windows, of which the date, judging by the free style of the tracery, belongs rather to the Decorated than to the Perpendicular period.

This church has an excellent example of Late Perpendicular work in the Tudor chantry, which is built at the south-east end of the south aisle. It is known as the Milcombe chapel and contains monuments to the Thorneycroft family of the village of Milcombe. Probably no other church of the same size contains a chapel which furnishes so many and such typical specimens of Perpendicular work; from it a student, without going further, might obtain a very fair idea of the characteristic features of that period.

The chapel is separated from the south aisle by an arcade of two bays; the arches are four-centred, and as four-centred arches were not used for constructive purposes until quite late in the fifteenth century, we may fix the date as late fifteenth or beginning of sixteenth century. The pier is composed of small members, each of which has its own separate plinth, which is very high and much subdivided; below these bases a pedestal or "footstall" is added for the entire group. The east window has seven lights and a four-centred arch. It is entirely typical of the period. The mullions are crossed by a transom which is ornamented by the Tudor flower. Three lights on each side of the centre are grouped together by an inner arch which takes the same curve as that forming the window head into which it is continued. The usual subdivision into many—and mostly vertical—parts takes place. On the outside the mouldings of jamb, sill and string have the characteristic curves, the large and shallow hollow being prominent. Inside, the sill, as well as transom, supports the Tudor flower; the mullions of the window are continued on the wall surface below, forming divisions for panelling. The upper row of niches is now filled with figures on pedestals, but these are modern. On each side of the window are the remains of canopied niches, which are mutilated. The south wall contains two similar windows, each of five lights, with more simple panelling beneath. These occupy almost the entire length of this south wall, excepting only a few feet against which, on the exterior, the buttresses are placed. The buttresses are narrow and of bold projection, capped with square pinnacles set diagonally. The jamb of one of the windows contains a piscina. In the west wall is another window of similar design to the others,

* A paper read by Miss B. Potts in connection with the Course of University Extension Lectures on Gothic Architecture.

but having, through want of space, only four lights. The stone altar, which stands against the east wall, is a reproduction of the original slab correctly moulded from remains found under the plaster. The east windows of the north and south aisles have been replaced by others of the Perpendicular period; that in the south aisle is exactly the same as the east window of the chapel.

The font (c. 1350) is panelled and ornamented with tracery of the Decorated period. There is a piscina in the east wall of the north aisle. The entrance to the rood-loft staircase and the exit still remain on the north side. The original rood-screen has been restored to good condition and repainted.

There are some remains of old masonry preserved in separate stones; one is Norman work with the zigzag ornament. Numerous fragments of ancient tiles have been found, and their patterns have been reproduced in the new flooring.

Remains of early wall-painting can be seen on the arches of the arcade over the north door and chancel arch, and in the chapel. A new wooden screen separates the Milcombe chapel from the south aisle. The pulpit is of Caen stone and elaborately carved.

The remarkably fine and varied work which this church contains, and the abundance of detail to be studied, demand so much time and attention that this paper is of necessity descriptive rather than historical or hypothetical; but as architecture is to a great extent history written in stone, it is almost as impossible as it is unadvisable to ignore altogether the life-history of the church.

At the time of the Norman survey the parish of Bloxham was part of the great estate of Edwin, Earl of Mercia. This Edwin, with his brother Morcar, and supported by Blidon, king of Wales, broke out into open insurrection, but being betrayed by three of his captains he was slain fighting, and his estate fell into the hands of the Conqueror.

Richard I. in the first year of his reign granted the church to the priory of Godstow, and afterwards the manor belonged respectively to Almaric de St. Amand, warden of the forest of Dean and governor of Hereford Castle (time of Henry III.), Roger de Beauchamp (1338), the Atwoods, and Mary, Duchess of Somerset (time of Henry VI.).

The Crown seems never to have entirely lost the power over the living until it was given by Edward IV., in the first year of his reign, to Eton College, in whose hands it still is, whilst the manor belongs to Lord Saye and Sele, having been in that family since the reign of Henry VIII.

The earliest church of which any trace can be found seems to have belonged to the time of King Stephen, who built here a chapel and gave two fields for a priest to say masses for the repose of the soul of his mother Adela, daughter of William the Conqueror. Of this building the head of the doorway in the chancel, the Norman mouldings in the chancel windows and the door of the south aisle are doubtless the remains, their original positions being only a matter of conjecture. The apparent Norman work in the chancel arch, with the exception of one small capital, I take to be new. This first chapel of King Stephen probably occupied the ground where the chancel now is and, contrary to the usual Norman custom, would probably have a square east end. There was in the first half of the twelfth century a bishop influence that joined hands with the old Saxon traditions of the square-ended sanctuary. More than this, Stephen's daughter Mary was abbess of Romsey, and there the idea of a square-ended presbytery is reached in work to be dated before 1125. At Winchester, too, Bishop Henri de Blois, Stephen's brother, gave a deep aisled presbytery to his hospital of St. Cross with a high square front.

Before the twelfth century the aisle had become the recognised addition for the enlargement of the parish church, and when the nave and aisles were built (c. 1220) the former church of King Stephen would be made to do service for the chancel of this parish church. The present aisle windows are of a later date than those that would be put in when the arcades were built; this however is no safe proof that the present walls were not built then, because windows were often taken out at later periods and replaced by larger ones. But the position of the south aisle door which is Norman work is the main reason which causes me to think that the aisles were entirely rebuilt and enlarged at a later period. Its present position could not have been its original place, because the arcade between the nave and this aisle belongs to a later date, and the arcade must have been built if not before at least at the same time as the aisle wall. This door is the only trace of Norman work to be found outside the chancel, and I should suggest that the chancel—which now is of about the same date as many of the windows of the aisles (1300-50)—retained its original form, which would be late Norman, until the first half of the fourteenth century, when it was entirely rebuilt and the original Early English aisles, which had been put up at the same time as the present arcades, pulled down and rebuilt at a greater width. In this way, that is the chancel and aisles being rebuilt at the same time, the Norman door in question would be removed from the chancel and put up in its present

place and the Norman mouldings in the chancel windows built in as they are to-day. That there is no trace at all of a window of the same period as the arcades seems to me to argue in favour of the walls having been entirely rebuilt. The original aisles would most likely be much narrower than the present ones, and probably the Early English doorway which can be seen in very fair condition at the Joiners' Arms, not far away, belonged to one of these aisles. The tower and spire would be built about the middle of the fourteenth century. Tradition ascribed the building of the spire to Cardinal Wolsey, but it rests on very uncertain authority, and the architecture points to an earlier date. The only reliable mention of the spire that I have been able to come across, though interesting, does not help to fix the date. It is from a paper which has been brought to light by Canon Dixon, where it is ordered by Lord Gray, in the reign of Edward VI., that John Wade, parish priest of Bloxham, should be hanged on the steeple there for his resistance to the change in religion. As regards the two-storeyed room over the south porch, there are three or four uses to which it may have been applied. It may have been a muniment-room (like that at Adderbury Church, which in so many respects resembles Bloxham), or a dwelling-place either for a chantry priest or the parish priest. If it had been for a chantry priest it would seem natural for there to have been an outlook on the east side overlooking the altar of the present chapel. Instead of this, however, there is on the first floor an opening which looks to the north; from it a good view can be obtained of the north transept, which containing as it does a piscina and aumbry was at one time used as a chapel, and so may have had a chantry priest attached to it. But this opening also gives a very convenient outlook over the greater part of the church, and would afford admirable facilities for night-watching and general supervision; steps lead into it from the interior of the church and from the general arrangements I am inclined to think it was the residence of the parish priest. There is a fireplace in the first room and from the staircase an easy exit on to the church roof. Late in the fifteenth or at the beginning of the sixteenth century the eastern end of the south aisle wall was evidently pulled down and the chantry built, and at the same time the east windows of both aisles were replaced by others, corresponding with those of the chantry.

At the western end of the north side of the chancel there is a recess which was probably a low side window. As the exterior is covered by a turret containing the rood-loft staircase it cannot be examined, but low side windows being in general use before rood-lofts became common, it is most likely that it was used as such until the staircase was built, when it was blocked up.

You will remember the theory about these low side windows, how it is supposed that they were intended, not for the use of lepers, but for the acolyte, who could ring a handbell through these openings at that part of the service when in many churches the sanctus bell was used. But I think it is not generally known that the name of "leper window" is comparatively a modern one, and originated from the discovery by Mr. Street of a wall-painting which seemed to represent a leper communicating at one of these windows. There is also another theory which contends that these windows were used in connection with the burial service; it has been thought that before it was the custom for the body to be brought into the church, the greater part of the burial service was said by the priest through the low-window. The ground on the south side of the church was usually the first to be converted into a churchyard, and this would seem to lend support to the theory, because the low side windows are commonly found on the south side of the chancel. In this way we might find a reason for occasionally finding one of these windows on each side, as we do here; when the churchyard was full on the south and burials commenced on the north it would necessitate another opening on that side.

At the western end of the clerestory there have been two openings, one on each side, like small windows; they are now filled in with stone, and at first sight are a little puzzling, but whoever will take the trouble to go on to the roof will, I think, have no doubt as to their meaning. The staircase from the upper room leads on to the roof of the chapel, and from there an opening through the parapet provides for access to the roof of the south aisle; from there one can trace exactly the same opening that was noticed from the inside, and these have evidently been formerly used for a passage across the nave, and so on to the roof on the other side of the church, which could only be reached from that side by ladders. There was, I believe, at one time a western gallery, and although these openings would be considerably higher than the gallery they may in some way have been connected through that; the western gallery being entered from the body of the church a ready means of exit to either roof would be obtained by these openings. In the eighteenth century the spire suffered repeatedly from lightning, especially in December 1790; it was then restored by Charles Cockerell.

The intense love of the churchwardens at the beginning of the nineteenth century for "neatness," which to them was synonymous with "whitewash," induced them to plaster the church to an unpardonable degree; even the upper part of the rood-screen and the arch over it was plastered over. The screen itself was painted slate colour all over. The font was defaced not merely with a coat of whitewash, but with a thick covering of red paint.

The church was restored in 1866 under the direction of Mr. G. E. Street at a cost of about 6,000*l*. The plaster was entirely removed, and, amongst other repairs, the nave was reroofed and the roof of the parvise covered with some fragments of the old nave roof. The rood-screen was restored, and the old colours carefully traced and copied. The roof of the north porch was reproduced exactly from the original one, of which they found remaining only one pair of principals. The floor of the church was retiled.

The sedilia were wholly obliterated, and the only thing found was the trace of them in the mortar of the masonry, which showed their shape. One or two fragments also were taken from the wall near them. The old piscina had been inverted and made part of the seat below. The hole in the present one, with a portion of the slab, is old; the rest had to be added.

After writing my paper I happened to come across some remarks made by Mr. Street when he restored this church. He said that they discovered that a great part of the wall over the window arches in the chancel was built of pieces of wrought stone, which had been used before. Some of these stones appeared to be the angle stones of a tower, and some the stones belonging to a spire. These are very interesting as proving that there was a spire before that which is now here, and Mr. Street suggested that this may have been central. I have not had an opportunity of revisiting the church since I found this suggestion, but from what I had learnt of the church on former visits I have been unable at present to find any place in its life history for a central spire. There were few, if any, stone spires entitled to that name in the Norman period, although their forerunners, the high pyramidal roofs, are sometimes spoken of as spires. Seeing, then, that the present spire is Decorated, it is almost certain that the former one would have been put up in the Early English period, and as the arcades belong to quite the beginning of the thirteenth century, it is hardly likely that the spire would be before them in date. Now if the tower and spire were central, and were built either at the same time or after the arcades, where were the supports of the tower? We see no traces of piers or columns likely to have been used for that, neither do we see any suggestion of these present arcades having been interfered with or added to when the tower and its supports might have been removed. The only variation in the regular planning of them is that the column of the eastern respond of the north aisle resembles those on the south in shape, but at present I cannot honestly bring forward sufficient evidence to support this theory.

It is interesting to note the similarity between this church and that at Adderbury. The planning of the two churches is on much the same lines. At Adderbury, between each of the transepts and the side aisles of the nave are two arches resting on clustered columns with sculptured capitals consisting of heads and figures similar to that here. Adderbury, too, has a cornice decorated with a series of grotesque figures and animals similar to that on the north aisle at Bloxham. The same blocked-up openings at the west end of the nave are also at Adderbury. Mr. J. H. Parker once described this church as one of the finest parochial edifices in the kingdom, and whether that may be questioned or not, it certainly illustrates almost every phase of the development of Gothic architecture.

The Gothic storey divides itself into three parts, corresponding roughly to three centuries, and we have at Bloxham not a few of the main characteristics of each. The slender rigidity of the upright shafts and the emphasised circlings of the capitals, with their hollow bells, are as typical examples of thirteenth-century work as is the leaf-capital of the Early English grace of natural suggestion. The many-mullioned windows with their variety of tracery, and the slender and high steeple, strike the keynote of the style which is associated with the fourteenth century. Leaving this luxuriant grace of the Decorated period we come, in this Perpendicular chantry, to the stiffness, the straight-lined tracery, the perfect stability of the last greatest church building which, in the Midlands, we find in great parish fabrics like those of Coventry and Nottingham.

The Tower of Selby Abbey is said to be in imminent danger, the parapet and cornices now being in such a state that a strong wind would easily dislodge them, and they might fall on the roof. As a result of a report from an expert the ringing of the bells has been discontinued. The cost of taking down the tower is estimated at 800*l*.

PUBLIC BODIES AND ARCHITECTURE.

THE first of two lectures under the Warburton Trust was delivered at Owens College on December 11 by Mr. Reginald Blomfield, whose subject was "Municipal Bodies and Architecture." Mr. Alfred Hopkinson, principal of the college, presided. The following report is from the *Manchester Guardian* :—

Mr. Blomfield said he did not propose to offer any suggestion as to the practical business details with which municipal bodies were concerned in relation to architecture; a far more widely reaching question was the mental attitude of municipal bodies towards architecture, the faculty of judgment which they possessed—or did not possess—as representing the average public. He hoped to show that there was here a growing necessity for wider and more intelligent education, and to offer some suggestions as to the lines that this education should follow.

Municipal bodies in modern cities had more important functions to discharge in dealing with architecture than anybody else. The buildings for which they were responsible were public buildings, and therefore were, or should be, monumental in character, with regard to the fact that they were built once and for all, for certain special and permanent uses. For good or for bad, they represented the average public taste and intelligence of the time. It was a reflection that should make the more thoughtful of our public men ponder on their misdoings with some misgiving, that future generations would look with wonder and contempt on the mere barracks and masses of vulgarity that had too often done duty for our hospitals and our town halls. Unkind things were said about modern architecture, all tending to the conclusion that there was no such thing, and that architects had nothing to say. This might or might not be the case, but it was not the fault of the architects. It was the fault of the bodies who employed them—bodies who too often took a very easy view of their responsibilities, and, considering architecture a matter of slight importance, cheerfully treated the selection of their architect as a matter of merely local and ephemeral interest. The attitude of town and county councils to architecture but too faithfully reflected the attitude of the general public towards that art. That this attitude was quite unsatisfactory there could be no doubt. He thought that any competent observer who took note of the average of architecture in our great cities would be driven to the conclusion that the general level of taste and ability was low. He would find that some of the least admirable of these buildings were the most admired. He would find, too, no common standard of appreciation, but merely a mass of unrelated judgments, amounting to little more than individual expressions of like or dislike. He would, in short, find public opinion in architecture in a state very little removed from chaos. He would find that there was no intelligent body of opinion to which a competent architect could appeal as a matter of course; and that the public in the pursuit of architecture were like sheep without a shepherd. The uncertainty of taste shown in the treatment of the public buildings of the last fifty years was conclusive evidence of the confusion of judgment which existed in the minds of our representative public men. There was no reason in the nature of things why this state of chaos should indefinitely continue.

It had not always been so in English architecture. In the seventeenth, and still more in the eighteenth century, when a building was to be erected such questions as had recently exercised the Liverpool Cathedral committee did not exist. Architects who were called upon to design a building knew exactly what they had to do. They had no necessity to clear the ground by a long preliminary discussion as to the style to be adopted. Everything went as smoothly as clockwork. But about 150 years ago a new element appeared. The amateur and the virtuoso assumed an importance which they had never previously enjoyed. Distinguished noblemen dabbled in design, and eminent men of letters amused themselves with architecture. Mr. Blomfield quoted the example of Horace Walpole, who, he said, subordinated architecture to the elegant insincerity of his own taste. When a direct attempt was being made to reproduce Gothic architecture, in obedience to a purely literary sentiment, it was hardly to be wondered at, he thought, that the layman should have lost his bearings. Thus the nineteenth century opened with three styles struggling for ascendancy—the old traditional Classic of Chambers and his school; the new Greek method, which was to be carried to such a high degree of excellence by Decimus Burton, and later by Thomson, of Glasgow; and, lastly, this revived Gothic. All architects of reputation followed one or the other of the first two manners. The amateurs stuck to the Gothic, and the amateurs carried the day; but when one considered that the whole force of the Romantic movement was behind them, the result was not surprising. So Wyatt, or Wyattville, started his career of architectural murder; Pugin followed, and threw himself into the cause with the enthusiasm of an ill-regulated mind; and then came Ruskin, a man of narrow prejudice but brilliant genius, whose eloquence won a sort of St Martin's summer for the Gothic movement, prolonging its life quite two

generations beyond the appointed time. All these men, from Walpole to Ruskin, seemed to have laboured under one very serious vice in their handling of architecture. It never occurred to them that architecture was an art which dealt with practical and immediate necessities, that it was founded on use and based on construction, and that the details which so much exercised their attention—Walpole with his ridiculous Gothic, Ruskin with his exquisite sense of detail, and no more—were not architecture at all, but mere words or phrases in its language. So Walpole treated architecture as a subordinate expression of literature. Pugin, and still more Ruskin, translated it into terms of ethics. The result had been that the sense of architecture as an art, with its own limits, its own technique and its own ideals, had almost disappeared, even among architects.

So far as the public was concerned, laymen had first of all lost their bearings in architecture, and finally had lost their interest in it, as being an art of no serious bearing on the immediate concerns of life, and therefore to be dealt with according to the fashion of the time, without regard either to first principles or to the teaching of the past. This habit of mind had been faithfully reflected in the conduct of the various bodies that represented the public. The history of public competitions for town halls and similar buildings erected in this country during the last fifty years was too painful to go into. But with rare and brilliant exceptions, the deplorable results were to be seen in every part of England to this day—in asylums that disfigured a whole countryside with their deformities and town halls that brought their cities to shame. As for public parks and gardens, in these we have reached the lowest note of vulgarity ever sounded in our country. These fiascos in municipal architecture were a matter of the last fifty years or thereabouts. Before about 1850 public buildings might have been unimaginative and dull, but the majority of them preserved some glimmering of an architectural sense; they regarded proportion, and were not devoid of a certain staid dignity. But this sort of thing would never do for the histrionics of the modern revivalist. He must have "something that knocks you down then and there," something to be talked about, something that would reproduce well in the art papers. The absurd thing about it was that meanwhile there existed a high degree of individual good taste and culture. The difficulty was to get this knowledge into line and to make its weight felt in municipal dealings with architecture. We needed to instil sounder and simpler views into the man in the street, to make him more anxious and inquisitive about the buildings he had to live with, and to suggest to him larger ideas as to his duty in the matter. It was pretty certain that if the public wanted good architecture and really cared about it to such an extent as to make it a matter of serious interest they would very soon get it. He thought that there was no lack of ability among the architects of this country; the only thing was that ability did not appear to be wanted. If it were, public bodies would hardly tolerate what they got in some of their public buildings. London, for instance, or the London County Council, would hardly permit magnificent frontages in new streets to be taken up by financial syndicates and covered by piles of hideous buildings which made one long for a second Nero. Important public buildings would not be handed over to mere office draughtsmen of unproved capacity; the care of our cathedrals and great public monuments would not, again and again, become what was more or less of a public scandal.

How were they to get at this state of indifferentism and to rouse municipalities and public bodies to a sense of their responsibilities? The question became one of education, and it was a question which in a great and intelligent city like Manchester should be seriously considered by its representative public men. Cities such as Manchester were not hampered by the traditions of the older universities; here, with a new foundation specifically designed to meet modern requirements, there could be no excuse for neglecting to provide for this growing educational need. There seemed to him, broadly speaking, to be three channels through which the public could be reached—(1) by direct school teaching; (2) by treatises on architecture; (3) by the works of architects themselves. With regard to the latter point, it must be obvious that in an art such as architecture, which must make appeal through the eye, the object lesson of a beautiful building was worth all the treatises in the world. But then, in the first place, the architect must be given the opportunity to design such buildings, and the public must have an eye to see them with when they were built. Hitherto, and until quite recently, no systematic public education in architecture had been attempted in this country. It had remained outside the lines of general education, and from this point of view had been considered rather as a mere hobby for which no special provision need be made in educational schemes. It was for the modern universities to remedy this defect and to organise a system by which, at the great provincial centres, not only technical instruction for the student, but some reasonable education in the nature and

history of architecture should be provided for the public. There was not only room but a growing necessity for more exact technical training in architecture. The old-fashioned system of articles, though not to be dispensed with, was not entirely satisfactory. His own opinion was that anyone who intended to become an architect should be put through a course of technical training as thorough as possible before he entered an architect's office at all. The means of such training should be provided at the great modern universities, and should include not only lectures, but practical training in workshops and laboratories. Moreover, this training should not be confined to architectural students only. It was a well-known fact that the great majority of buildings erected in this country were not designed by architects at all, and it was also a fact that many contractors depended upon clerks and foremen for their practical knowledge. We should hear a good deal less of buildings tumbling down before they were up, of drains laid the wrong way, and the like if all builders had to go through a course of good practical training. Moreover, the speculative builder might avoid some of his worst iniquities of taste if he had any, even the most rudimentary, acquaintance with what had actually been done in architecture. After the technical training was completed the work, of course, must become more or less educational, and it was evident that some highly trained controlling mind would be necessary to undertake this education in the art of architecture. Such a teacher would indeed have his work cut out for him, for it would be his business to clear the air of misconceptions and to lead not only students, but the wider circle of an intelligent public to a sounder appreciation of the theory and function of architecture.

At this moment the public—that was to say, the average man—did not appreciate or understand architecture. In the first place, there was that old stumbling-block of offence, the question of styles. It was evident from a recent controversy in regard to a great building enterprise, that to the lay mind architecture presented itself as a question not of style, but of a style. That was to say, he must be able to label it as definitely Gothic or Classic or Greek or Egyptian, or whatever else it might be. This meant that a design should present such a number of familiar features that it would be at once pigeon-holed a Gothic or Classic, because even the layman could see that it reproduced the mouldings and traceries, or the orders and entablatures, which he had learned from his text-books to be the distinctive features of the style in question. So the layman went his way quite satisfied. He thought that he had got his style according to his prescription, and fancied that he was building as good a Gothic cathedral or Classical temple as was ever built in the days of Edward I. or Pericles. But he was not; he was only getting a more or less knowledgeable copy; he was getting not architecture but archaeological pedantry; and the better it was the worse it was, because so far it divorced architecture more effectually than ever from the actual uses and necessities of the world we live in. Such a professor as he had suggested would make it clear that these styles were merely the classifications of historians, often of amateurs; that they were merely labels of identification dealing with exteriors only, and that behind them there was an elusive spirit to be caught, the real meaning of architecture. It would be a great thing once and for all to clear away this initial misconception of architecture, but there were others hardly less formidable. The way out of the present welter was not easy. A century or more of experiment in the arts had brought little but disappointment and disillusion. Perhaps it was in this latter result that the hope for the future lay. Signs were not wanting of a half-articulate revolt against the two extremes of architectural disease, scholasticism on the one hand and commercialism on the other. We must learn to look upon architecture as a living art, not "complete and exhausted," as a distinguished critic made bold to say the other day, but with possibilities of development waiting to be found, not less varied than in the happy days when architecture was a vital force.

Mr. Blomfield was thanked for his address on the motion of Mr. Alfred Darbyshire (president of the Manchester Society of Architects), seconded by Professor Tout. Professor Tout said that they hoped to found a chair of architecture at Owens College in the near future. It might be asked why there was not already such a chair in existence, but the reason was that the funds of the College were not adequate at the present moment for this new venture. If they could only get a little money to start with they would do their best to found the chair and to get the right man to fill it.

Mr. Blomfield, in responding to the vote of thanks, said the establishment of a school of architecture at Owens College would meet a very great need, and he wished Manchester all success in the enterprise.

The Tunbridge Wells Town Council have decided to appoint an art master at 270*l.* per annum and a new head master of science at 250*l.* per annum for the municipal schools.

PREHISTORIC TUMULUS AT SUNNINGDALE.

IN the course of making new golf links on the grounds of Mr. T. A. Roberts, at Sunningdale, near the railway station, it was discovered by Mr. Craig, the contractor for the work, that a mound which it was proposed to utilise for "teeing" contained burial urns. He at once communicated with the Reading Museum, and on November 27 Mr. O. A. Shrubsole, F.G.S., the curator of the geological and anthropological department, with Mr. Colyer, the assistant curator, proceeded to the spot. Three urns had already been disinterred. As the result of further examination, says the *Reading Mercury*, fourteen more were discovered and removed, besides which indications were found of two interments of ashes not deposited in any urn, but probably enclosed in a cloth which had since decayed. It should be stated that all the vessels contained small fragments of bone partly burnt, with carbonaceous matter and soil, indicating in each case that the body had been cremated, and that a portion of the ashes had been placed in the urn and then covered up by earth. In eight cases the urn was found in an inverted position. As such an arrangement would be unnatural in the ordinary way, it may legitimately be held to indicate a fear lest the spirit of the dead person should escape from the urn. Such indications are not unusual in ancient interments. Among imperfectly civilised races there is frequently a strong disposition to fear and to propitiate the spirits of the dead.

The mound itself is distinctly artificial and circular in form. The diameter is 75 feet, but this has probably been increased by the washing down of the soft sandy soil of which the mound is composed. Its present height is 6 feet, but it was doubtless originally higher. The urns were found generally about 1 foot from the present surface, and appear to have been deposited in a systematic manner about 3 feet apart near the centre of the mound and inclining to the western side.

From the imperfect condition of several of them it is likely that the mound may have been disturbed in ancient times. Accidents might even have occurred at the time of the burial of some of the urns. In one case an urn was found slightly overlapping another.

The crust of the urns was in almost every case of clay baked red and strengthened by fine flint grit. They are all rudely hand-made. Only a few bear any ornamentation, and then in the form of a band or fillet round the urn, either plain or studded with pits or hollows. The urns differ in size, shape and ornamentation: scarcely two are alike.

It is obvious therefore that we have here a cemetery, the remains of an ancient crematorium. The size of the urn in each case might be thought to indicate the importance of the deceased person, yet no one person appears to have been of sufficient importance to have a mound to himself. We have therefore evidence of a settled community living near the spot. It is of interest in connection with this that there is an ancient earthwork about a furlong south-east of the mound.

It being important to ascertain whether the tumulus contained any earlier interment, a further investigation was made by Mr. Shrubsole on December 2 and 3. A trench was cut from north to south through the centre of the mound. Nothing whatever was met with. The soil was entirely composed of the sand of the Bagshot beds, with occasional traces of carbonaceous matter and a few split pebbles. Cross-cuts were also made from east to west, and the centre was dug for a depth of 2 feet below the original surface of the ground. The result showed that the mound was raised simply as a receptacle for the urns deposited in it, or possibly that any primary interment had decayed.

These are all of rude British make, and therefore may safely be ascribed to a time before Britain came under Roman influence.

In the absence of any vestige of a weapon or ornament the exact age of the burials cannot be determined with certainty, but from the shape of the mound, the care evidently exhibited in the disposal of the dead and the evidence of a village community, we shall not be far wrong in saying that they belong to the age of bronze, and probably to a late rather than an early date in that age in this country. Here, in fact, were deposited the remains of "the rude forefathers of the hamlet." Some of the urns are 1 foot 4 inches in diameter; others are much smaller, and some interments were not thought worth any urn at all. A few ashes were deposited with some rough pieces of sandstone, and in one case a slab of conglomerate from the gravel on the top. Another such slab was noticed in the surface-soil of the mound. The split pebbles referred to might have had a symbolic meaning.

It should be stated that the top of the mound was levelled about seven years ago. This will further account for the imperfect condition of the urns, the inverted ones having lost their bottoms and the others having had the upper parts more or less destroyed.

In connection with this matter, it is of interest to note that the modern crematorium at Woking is only a few miles distant, which shows how difficult it is to be original.

ARCHITECTURE AND RELIGION.

THE opening meeting of the session of the Architectural Section of the Royal Philosophical Society of Glasgow was held in the rooms, 207 Bath Street, Glasgow, on Monday evening. Mr. James Chalmers, I.A., the president, delivered his opening address upon the sphere of the architect in relation to religious art. Referring to the recent union of the several denominations and the tendency towards union with the Episcopal Church, it was well for the architect to consider where he stood in regard to church planning, which was more or less following the Episcopal or Roman plan. It appeared to the lecturer that churchmen were becoming convinced that a church was not a house for holding so many worshippers in area and galleries, with the necessary pulpit and organ, but that it was in another sense the house of God. There was no doubt but that the privilege of the architect was to build a church which, as far as possible in form and decoration, embodied all religion; and it was curious to notice the extent to which the building trades, or societies akin to them, had reduced religion and morals to geometrical forms, and were thus able to embody these in stone, giving to each its religious meaning. It was partly because of the simple proportions in the architecture of the Old Testament, with its beautiful symbolism, which inspired the Christian Church in the Middle Ages to favour the triangle as compared with the square. The central idea was the symbol of the glory at the altar, and the ornament appeared to represent the rays. Any church union must be upon the central doctrine of unity in trinity and trinity in unity, and the universal church plan would be built upon the beautiful symbolism of this mystery. The lecturer then traced the development of church planning and ornament from early times, and illustrated his lecture with views of Jewish and Christian temples and churches. At the close a vote of thanks was awarded to the President for his address.

GENERAL.

Mr. J. S. Sargent, R.A., has been elected a correspondent of the French Academy of Fine Arts in the room of the late M. Guffens, the Belgian painter.

The Gross Valuation of the Metropolitan boroughs is declared to be 40,365,897 $\frac{1}{2}$, the rateable value being 33,350,433 $\frac{1}{2}$, and of the City of London 5,890,020 $\frac{1}{2}$ and 4,888,378 $\frac{1}{2}$ respectively.

Mr. Herbert Draper's painting, *Tristram and Iseult*, exhibited in this year's Royal Academy, has been purchased by the Corporation of Liverpool for their permanent collection of pictures.

The Glasgow Parks Committee have resolved that all the International Exhibition buildings shall be taken down forthwith, with the exception of the machinery hall, which is to be retained for storage purposes. The other buildings will be disposed of by auction.

Sir Joshua Reynolds's Palette—inscribed "This palette of Sir Joshua Reynolds is presented with J. M. W. Turner's sincere regards to Sir Martin Archer Shee, P.R.A., January 1, 1832"—sold for twenty-seven guineas on Tuesday. Sir Edwin Landseer's painting palette and easel brought 3 $\frac{1}{2}$ 5s.

The Pennsylvania Road Company are about to construct a tunnel under the North River and another under the East River at New York, so that the terminals of the Pennsylvania and Long Island railroads will be connected. The cost of the undertaking is estimated at 10,000,000 $\frac{1}{2}$, and between three and four years will be required to complete the work.

The London County Council on Tuesday accepted the recommendation of the historical records and buildings committee that the work of indicating by means of memorial tablets houses of historical interest in London should be continued. The Society of Arts have hitherto been engaged in setting up similar tablets, but are desirous of being relieved.

M. A. Bessard, the French painter, has been elected president of the section of "Objets de l'Art," for the Salon exhibition, in succession to the late M. Cazin.

The London Corporation have purchased from the owners of the freehold Spitalfields Market for 176,750 $\frac{1}{2}$.

The Gallery of Modern Art in the Luxembourg, Paris, is so crowded it is proposed to erect a larger gallery in the garden which is to be formed in the Champ de Mars.

The Sanitary Inspectors' Examination Board will hold an examination in London on January 21 next and four following days. Particulars will be forwarded on application to the honorary secretary, Mr. Wm R. E. Coles, 1 Adelaide Buildings, London Bridge, London, E.C.

An Exhibition of modern English furniture will be opened in March next at the Hungarian Museum of Decorative Art, Budapest.

THE

Architect and Contract Reporter**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

IMPORTANT NOTICE.

Owing to the Christmas Holidays, all Advertisements, Tenders, &c., for the issue of December 27, must reach the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 p.m., on Tuesday, December 24.

COMPETITIONS OPEN.

AUSTRALIA.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

BATTERSEA.—Jan. 31.—Premiums of 50*l.*, 25*l.* and 10*l.* respectively are offered for the three best sets of designs, &c., of dwellings, as follows:—(a) A house of two storeys; (b) a house consisting of two self-contained tenements; and (c) a house consisting of three self-contained tenements. Mr. W. Marcus Wilkins, town clerk, Municipal Buildings, Lavender Hill, S.W.

GLASGOW.—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

HULL.—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

IRELAND.—Jan. 20.—Plans, &c., are invited for drainage of Howth and Sutton, Dublin (and an alternative system for the latter). A premium of 50*l.* is offered. Mr. John O'Neill, clerk, board-room, North Brunswick Street, Dublin.

ISLE OF WIGHT.—Jan. 31.—Designs are invited for a suitable monument as a memorial to Her late Majesty, to be erected in St. James's Square, Newport, Isle of Wight. A premium of 25*l.* is offered for the accepted design. The Secretary, Isle of Wight Queen Victoria Memorial Committee, 20 Holyrood Street, Newport, Isle of Wight.

KENT.—Jan. 1.—Competitive designs are invited for laying-out about 16 acres of land, near Canterbury Road, Gillingham, as a recreation-ground. Premiums are offered of £20, £10 and £5. Mr. F. C. Boucher, clerk, Gardiner Street, New Brompton, Kent.

LANGHO.—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

SCOTLAND.—Jan. 15.—The Kirkcaldy Burgh School Board invite competitive plans for a technical and science and art school to accommodate from 400 to 500 pupils, and an elementary school to accommodate about 400 pupils. Mr. Alexander Beveridge, clerk to the Board.

WALES.—Feb. 4.—Competitive designs are invited for municipal offices proposed to be erected by adapting, adding to and rearranging the town hall buildings at Mountain Ash. A premium of 75*l.* will be paid to the author of the design placed first in order of merit. Mr. H. P. Linton, clerk, Town Hall, Mountain Ash.

CONTRACTS OPEN.

ASHTON-IN-MAKERFIELD.—Jan. 8.—For supply of a steam road-roller, 12½ tons, a scarifier and a sludge and snow remover. Mr. J. W. Liversedge, surveyor, Council Offices, Ashton-in-Makerfield.

BAKEWELL.—Jan. 3.—For construction of a circular water-tight concrete reservoir to hold about 115,000 gallons, in the parish of Hassop, and the construction of a circular covered water-tight concrete service tank to hold about 50,000 gallons at the Headstones Head, in the parish of Ashford, and other works in connection with the proposed water-supply. Messrs. Sterling & Swann, engineers, Town Hall, Chapel-en-le-Frith.

WALES.—Jan. 15.—For erection of a school at Alltwen. Mr. W. Watkin Williams, architect, 63 Wind Street, Swansea.

WALSALL.—Jan. 18.—For construction of a sewage tank 85 feet long by 21 feet 6 inches wide by 9 feet deep. Mr. John R. Cooper, town clerk, Borough Offices, Walsall.

WEST HAM.—Jan. 14.—For supply of four sets of surface-condensing plant, each to deal with 40,000 lbs. of steam per hour, complete with electrically-driven air and circulating pumps, and one travelling crane to carry 30 tons, span 67 feet. Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham.

WOODFORD.—Dec. 28.—For erection of steel tower, wind-mill pump, rising main, &c., at Woodford, Northants. Mr. Lloyd, engineer, Thrapston.

A NEW appeal has been issued for the repair and restoration of Chichester Cathedral for funds to carry out the works which the late Sir Arthur Blomfield declared to be urgent. The report prepared by that eminent architect just before his death last year has been published, and confirms the previous accounts by Mr. J. L. Pearson and others as to the serious state of decay which exists in some portions of the venerable edifice.

BUILDING AND BUILDERS.

LANCASTER School Board on the 17th inst. let tenders for the alteration of the Skerton British school into a Board school, and for a new infant school, the total cost being 8,711*l*.THE tender submitted by Messrs. F. Gough & Co., Church Road, Hendon, has been accepted for the East Finchley Baptist school church building, which is at present to act as a church and school combined until the church proper is erected. The contract amount is 3,634*l*., and the work is now commencing. The architects for the scheme are Messrs. G. & R. P. Baines, 5 Clement's Inn, Strand, W.C.THE Local Government Board have granted the Corporation of Heywood permission to borrow 1,263*l*. for the purchase of land for the Heap Bridge sewage scheme. Application had also been made for powers to borrow money for the erection of a destructor, the Heap Bridge sewage works, the Captain Fold drainage system, &c., and the Board intimate that they will communicate further with the Corporation on these other matters.

A LIMITED liability company has recently been formed at Port Glasgow for the purpose of building and carrying on a

workmen's home on the most approved model lodging-house principle. The proposed building, the plans of which are in course of preparation, will be capable of providing accommodation for 500 beds, with all the necessary dining and other halls. Only 250 cubicles, however, will meantime be furnished.

THE Marylebone Housing Council have agreed to call a mass meeting in the West London Theatre, the object being to urge the Marylebone Borough Council to put into force the provisions of the Housing of the Working Classes Act. The speakers will be Sir Samuel Scott, M.P., and Canon Barker. A deputation of the Council have met Lord Howard de Walden, who stated that he had set aside 2 acres at Grove End Road for artisans' dwellings, the other part being reserved for the erection of a Lord Rowton House.

THE designs of Messrs. G. Baines & R. P. Baines, of 5 Clement's Inn, Strand, have been accepted for St. Andrew's Street Baptist church, Cambridge. The building is to be faced with whole white flints, the dressings, tracery, &c., being of red Mansfield stone. A bold square tower forms a prominent feature of the design. The joinery is to be of oak. The seating accommodation is about 950 persons, and the estimated cost is 6,200*l*.AN expensive infirmary scheme for Stratford-on-Avon Union Workhouse was considered by the Board of Guardians at their last fortnightly meeting. The workhouse management committee reported that the plans for a new infirmary had been approved by the Local Government Board, but before proceeding further with the architect's scheme for the new laundry and the supply of hot water and heating apparatus for other portions of the workhouse buildings, they desired to know whether the Board were prepared to expend the sum of about 4,000*l*. on the proposed works, in addition to about 5,000*l*. on the new infirmary. The report was adopted, the new proposal mentioned in the letter being reserved for future consideration.

A LABOURER named David Jones, in the employment of Messrs. H. Johnson & Sons, slaters, Pembroke Place, Liverpool, met with a serious accident on the 16th inst. Jones was engaged carrying slates up a ladder leading to the inside of the tower on the new building in course of erection at Messrs. Ogden's, Limited, West Derby Road. He overbalanced himself and fell a distance of nearly 40 feet, when he alighted on the back of the neck of a man named Patrick Shiel, who was working below. Jones then rolled over, and would have fallen a further distance of 15 feet down the staircase but for Shiel,

Council Chamber at Hemel Hempstead, fitted and furnished by HEWETSONS.

who caught him by the leg and dragged him away. Jones was found to be badly injured, and bleeding from wounds about the head caused by the falling slates. He was removed to the Royal Infirmary suffering from severe scalp wounds and shock. Shiel received a severe strain and shock, and was attended to by a neighbouring chemist.

MR. FENWICK, contractor, has started work in connection with the construction of the bridge over the Great Western Railway to connect Small Heath and Sparkbrook, Birmingham, for which a loan of 49,000*l.* was recently sanctioned by the Local Government Board. The open lattice-work girders will be supported by steel piers and columns. The largest span is 144 feet 9 inches and the height of the biggest girder 19 feet. The flooring which carries the roadway will be built on cross girders 3 feet deep. It will be a wide carriageway, wood-paved, with footpaths on either side. A stone-pointed bridge will carry the roadway over the Warwick and Birmingham Canal. The total length of the whole viaduct will be 950 feet, including the approaches. Present operations relate to the concrete foundations, which will have to bear a weight beneath the principal piers of a ton and a half to the square foot.

AT the reading-room, Great Brington, Northants, on the 11th inst, Mr. W. H. Ducat, inspector of the Local Government Board, held an inquiry into the application of the Brixworth Rural District Council for sanction to borrow 500*l.* for sewerage and sewage-disposal works for the parish of Brington. Mr. Woodford, clerk to District Council, stated that the population of the parish of Brington, which included Little Brington, Great Brington and Nobottle, was 643, while the rateable value was 3,674*l.*, and the outstanding loans amounted to 1,192*l.* Mr. Lewis, the sanitary inspector, produced the plans of the old sewage farm and the plans for the proposed new one. He explained that there were already two small filter-beds, which were laid down in 1892, but these were not large enough, and so it was proposed to add one acre for Great Brington and another acre for Little Brington, while sixteen houses on the south side of Great Brington, which had not been included in the previous scheme, would be sewered. The new filtration-beds for this part would be 2 r. 20 p. in area. The two acres belonged to Lord Spencer, while the last-mentioned land belonged to the Brington Charity Trustees. These owners had no objection to the scheme, and the leases were being prepared. The inspector afterwards viewed the site.

At the Hanley Town Hall on the 12th inst. a meeting of representatives of local authorities was held on the subject of

the proposal to erect a joint hospital for the treatment of small-pox cases on land acquired at Bagnall, Staffs. Mr. W. O'Keeffe was voted to the chair. Letters expressing willingness to join in the scheme were received from Cheadle rural district, Fenton urban, Hanley urban, Leek urban, Stoke urban, Stoke rural, Burslem urban and Tunstall urban councils. Longton, it was stated, were considering the matter, and Mr. Elliott (Newcastle) said they were having a meeting there immediately, and he was of opinion that they would join. The town clerk of Hanley (Mr. A. Challinor) said the population of the district named was 217,929, exclusive of Newcastle and Longton; with the latter towns it would be 273,668. The chairman moved that a smallpox joint hospital board be formed, and that Mr. Challinor take all necessary steps for carrying out the resolution. This was seconded by the Mayor of Stoke. Alderman Leak (Longton) said his Council viewed with favour a united district, and they were there to gain further information. The chairman detailed the proposed scheme, and Alderman Leak said they should have an answer from Longton in a few days' time. Dr. Reid, county medical officer, expressed the opinion that other districts would also join. The motion was carried, as was a further one to the effect that the Staffordshire County Council should be represented on the board by one member, in order to enable it to contribute under section 2, subsection 1, of the Isolation Hospital Act of 1901.

THE Dean of Westminster on Thursday, the 12th inst, laid the corner-stone of the church of the Holy Trinity, now in the course of erection in Prince Consort Road, South Kensington. In pursuance of an Order in Council the present church of the Holy Trinity, Knightsbridge, will be taken down, the site sold, and the proceeds given to the purchase of the new site and towards the cost of the erection of the new church. The site on which Holy Trinity now stands has been valued by the Ecclesiastical Commissioners at between 14,000*l.* and 15,000*l.*, which sum they are empowered to advance upon the new site and the building, and this site having been acquired for 6,000*l.*, a sum of between 8,000*l.* and 9,000*l.* is left to go towards the 25,194*l.* required for the new church, leaving 17,000*l.* to be raised. The building now being erected has been designed by Mr. G. F. Bodley, A.R.A., and will accommodate about 800 people. The plans show a wide nave and chancel aisles, wide and lofty piers and arches, and traceried windows. It will be of English Gothic architecture and partake of the character of a town church in the style and manner of the fourteenth century. Stone arches of a bold character

will be thrown across the aisles, in keeping with the stone of which the church is to be built, and provision will be made for a morning chapel, spacious vestries and a parish room. The building is to be completed by September 1903, subject to the response to an appeal for financial help that has been issued.

TRADE NOTES.

MESSRS. COUSLAND & MACKAY, ventilating engineers Glasgow and Manchester, have carried out the ventilation of the Industrial school, Witton, Birmingham, by means of Mackay's patent direct-acting ventilators, of which they are the sole makers.

MESSRS. W. POTTS & SONS, clock manufacturers, Leeds and Newcastle-on-Tyne, are making and fixing a chime clock for the parish church of Marske-by-the-Sea, Yorks, for the Marquis of Zetland, in memory of the late Queen Victoria; one at Guisborough ancient parish church in the same vicinity for the Urban District Council; another at Lanchester, near Durham, for the above object, presented by Mr. Wm. Logan, J.P., chairman of the Urban District Council; and one at Saltburn-by-Sea parish church, also as a memorial to Her late Majesty the Queen.

ELECTRIC NOTES.

THE engineers of the Manchester and Liverpool Electric Express Railway Company have just deposited the plans for the new line with the Board of Trade. The plans include measurements for the permanent way and the steel superstructure of the Mono railway, together with the necessary details.

At the next meeting of the Bognor Urban Council, estimates, plans and specifications for providing electric light in the town will be considered, and a resolution will be moved in favour of making application to the Local Government Board for sanction to borrow the sum of 12,000*l.* for the purpose of the installation.

A REMARKABLE clock is now working at Schenectady. It was made by a watchmaker named J. Steiner, and has never been wound up. It was started some months ago by Steiner giving the pendulum a swing, "and will continue to go," says

he, "until the magnets lose their magnetism." The works consist of only three wheels. The clock itself is in the form of a pendulum, weighing 40 lbs. The pendulum rods are made of different kinds of metal to allow compensation in contraction and expansion. It is said that the clock is not affected by jar or vibration, and keeps perfect time, the swing of the pendulum being regulated to beat seconds.

THE Electric-Lighting Boards Company announce that their French representatives were able at three days' notice to instal the entire electric-lighting system of the numerous stalls at the great Automobile Exhibition in the Grand Palais of the Champs-Élysées, the number of lights applied in this limited time being no less than 6,000. Both the technical and daily Press of Paris consider the achievement a remarkable one and above any French time record, even including the company's rapid installation at Compiègne on the occasion of the Czar's visit.

At Sutton Coldfield, Warwickshire, on the 14th inst, the new electricity supply works, which have been erected at a cost of 26,000*l.*, were opened with considerable pomp and circumstance. They are situated upon the site of the old gasworks at the corner of Riland Road and Coleshill Road, and occupy an area of 1,000 square yards. In their structure there is no unnecessary ornamentation, but they are convenient and compact and as pleasing in external appearance as the situation of the site warranted. The buildings, which are of ordinary red bricks with Bath stone heads and sills to windows, have two Tudor roses carved upon each of the stone window and door heads, and the borough arms over the main entrance. Three engines and dynamos are at present in the building, and a space is provided for a fourth set when required. The chimney stack is octagonal, and is 150 feet high. The generating plant, &c., are of the best to be obtained, and will meet the requirements of the district for some time to come.

THE sanitary committee of the Leeds Corporation have approved of a resolution of the hospitals committee to proceed with the erection of a temporary hospital at Manston for diphtheria cases, which are becoming very numerous throughout the city.

MR. H. T. CROFTON, clerk to the Moss Side District Council, a position which he has held for nearly a quarter of a century, has sent in his resignation, and it has been regretfully accepted by the Council.

THE Secretary of State for India has sanctioned an expenditure of 1,050 lacs of rupees on railways for next year, and of 100 lacs on irrigation works. The former includes 325 lacs for rolling stock, 180 lacs for other necessary works on open lines, 350 lacs for lines being constructed, and 174 lacs for new lines, including the Allahabad-Faizabad line with a new bridge over the Ganges.

THE cottage home at Dodleston, which has been erected by the Chester Board of Guardians, was opened on the 4th inst. This home, which was designed by Messrs. Lockwood & Sons, will accommodate twelve children. It is in two storeys, the ground floor consisting of a large day-room, entrance hall, kitchens and storerooms, while upstairs are two large dormitories, mothers' room, sick-room, bath-room, &c.

THE new entrance channel to the upper dock at Aberdeen has now been opened for traffic. To the s.s. *Spray* fell the distinction of being the first vessel to pass through, cutting the ribbon of red, white and blue that stretched across the waterway. In honour of the occasion the steamer was gaily decorated with bunting. The construction of the new Regent bridge, which has rendered this new channel necessary, is making satisfactory progress. Its total cost will be upwards of 50,000*l.*

THE decoration of the Blackpool Council Chamber has now been completed. The ceiling, with its fine cove, is decorated in a boldly-modelled plaster, and has been subjected to a very simple colour treatment so as not to compete with the rich decorations below. The walls are framed in with a high dado, and pilasters in oak left unpainted in its natural colour. The wall surfaces, left uncovered by the oak, have been formed into five panels, two of which are treated with conventional ornament and armorial bearings, while the remaining three spaces are decorated with pictures illustrating episodes in Lancashire history. Over the mayor's chair a large picture typifies the reconciliation of the Yorkists and the Lancastrians, representing as it does the marriage of King Henry VII., of Lancaster, to Princess Elizabeth, of the House of York. The wedding was solemnised in Westminster Abbey in January 1486, and

rivalled the Coronation ceremony which it followed in splendour. Care has been taken to represent as faithfully as possible the ecclesiastical and court costumes and usages of the times. The second picture over the press and public platform represents an event perhaps more closely connected with the Fylde district than is represented in the others—the "Surrender of the Rebels at Preston in 1715." The third picture to the right of the mayor's chair depicts the "Last Desperate Charge of Richard III." The doomed king is shown in full plate armour (copied from the magnificent suit in the Wallace collection), and wearing his tabard and helmet surmounted by the crown of England. These three mural pictures are well composed and strongly painted, and add greatly to the stateliness of the chamber. The internal fittings are all in oak, and are rich and imposing in character. The arrangement gives a raised platform and desks for the mayor, deputy mayor and town clerk at the north end. The aldermen and councillors' desks and seats are arranged in horseshoe form in order that each member shall face the mayor. Great attention has been given to the carving of the mayor's chair and those immediately adjoining it. The pictures were painted by Mr. J. R. Brown, the superintendent of the art department of Messrs. Goodall, Lamb & Heighway, Limited, who carried out the work under the superintendence of Messrs. Potts, Son & Hennings, the architects of the building.

HYDRAULIC MACHINES.

At the monthly meeting of the Gloucestershire Engineering Society Mr. F. J. Platt, M.I.M.E., read a paper on "Some Hydraulic Machines." He said the use of water as a natural source of power was well known to the engineers and philosophers of olden times, but it was not until the sixteenth century that the force pump was invented, by means of which water was pumped to a great height, and stored for distribution under pressure. It was interesting to find that the authorities of our ancient city were amongst some of the first to appreciate the value of a good water supply, and it is recorded that in the middle of the sixteenth century "The Mayor of Gloucester with the Dean of the Church was authorised to convey water in pipes of lead from a neighbouring hill, satisfying the owners of the ground for digging thereof." He confined his attention to machines actuated by pressure obtained by means of an "artificial" head. It was due to the inventive genius of the late Lord

Armstrong that they owed the "hydraulic accumulator," which produced an artificial head by weight instead of by elevation, this being about fifty years ago. The first one made was of very simple design, and consisted of a vertical hollow ram fixed into a base plate resting on the ground. The cylinder was inverted and encircled with cast-iron weights which were raised by the pumps, the static pressure being 700 lbs. The enormous value of this invention is realised when they remembered that a tank or reservoir would have to be placed at a height of 1,590 feet in order to obtain the same pressure, and also that one of the ordinary size, say, for example, having a ram 12 inches diameter by 20 feet stroke, is capable of giving off 575 horsepower at a single stroke. This system was peculiarly suitable for transmitting power over great distances, the loss by friction being only about 2 degs. per mile, and it has been almost universally adopted for the working of cranes, lifts, capstans and such-like machines in docks, railway depôts, &c. There are also hydraulic central stations for supplying power to the public in London, Liverpool, Manchester, Glasgow and Hull. As Lord Armstrong was the pioneer of general hydraulic machinery, so was the late Mr. Ralph Hart Tweddell of special hydraulic machine tools for such operations as rivetting, flanging, punching and shearing, &c. It may be of interest to some of the members to know that it was in Gloucester that Mr. Tweddell first took much interest in engineering. He was a student at Cheltenham College in 1860, and used to come here and spend many of his half-holidays in the works with the lecturer's father, who was then manager at Messrs. Savory & Son, the predecessors of Messrs. Summers & Scott. They kept up a correspondence for some years, and became intimately associated when in 1871 he concluded an arrangement with Messrs. Fielding & Platt by which they became the sole manufacturers of machines under his system. He adopted a working pressure of 1,500 lbs. to the square inch, which was considered to be too high by most engineers, but it had the advantage of reducing the size and weight of the cylinders, which is especially important for portable rivetters, and, furthermore, little trouble was experienced in keeping tight joints. There was a peculiarly stubborn prejudice to be overcome before the system became fully recognised, and this was accomplished chiefly by the high honours gained at the Paris Exhibition of 1878, where a complete rivetting plant was in daily operation. About the same time the French Government laid down a large hydraulic installation in some new shops at their Toulon Dockyard, consisting of machines

specially designed for rivetting, punching and shearing, bending and straightening angle and channel irons, and for stamping and flanging iron plates for ships. There was no shafting or gearing, all the machines taking their supply from one set of pumping engines and accumulator. Their performance was most satisfactory, the simplicity of construction and the absence of noise and vibration being most marked. This was the turning point, and at the present time the use of hydraulic machinery is extending in every direction, no important boiler shop, shipyard or girder works being considered complete without it. For the heaviest class of forgings the hydraulic press has already superseded the steam hammer, it being found that the quiet, steady and sustained pressure applied reaches the centre of the forging and gives the material time to flow naturally, while the short and sharp blow of the hammer expends itself on the surface of the forging and foundations. This is clearly seen by observing the ends of a forged shaft, that done by the press being convex, thus proving that the metal has actually flowed from the centre, whereas that done by the hammer is concave. When they considered the extreme simplicity and fewness of working parts of practically all hydraulic machines, together with the fact that they consume no power whatever except when actually doing work, and that very inexpensive foundations are required, it was only natural to expect that their field of usefulness would be still further extended as time goes on.

ELECTRICITY AT MAIDSTONE.

MAIDSTONE wore quite a festive air yesterday (Thursday) evening in anticipation, and afterwards in celebration, of the inaugural switching on of the electric light, the successful installation of which has just been completed. The question of the installation of this illuminant was first seriously discussed in 1890, and after a chequered course it was ultimately decided by the adoption of the scheme of Messrs. Stevens & Barker, electrical engineers, of Maidstone, in conjunction with a scheme prepared by the borough engineer (Mr T. F. Bunting) for a dust-destructor. The Fair Meadow was the site chosen for the station, and its close proximity to two large breweries gave rise to grave opposition to the dust-destructor, the scheme for which was abandoned at the time of the public inquiry. Sir William Preece was, on the suggestion of the Local Government Board, consulted with regard to the light, and he having reported

The POLICYHOLDER'S COMPANY

A POLICYHOLDER'S TESTIMONY.

In acknowledging the receipt of a Cheque for £3,883 6s. 5d. in settlement of Endowment Policy No. 453396 for £3,000, allowing a bonus of nearly 3 per cent. per annum for 10 years, the Policyholder writes:—

"Had I taken a fully paid-up Policy instead of the above amount in cash it would have been £257 in excess of the figures given to me when I took out the Policy 10 years ago. I have given expression to my satisfaction by taking out a fresh Policy in your Company for £10,000 on the Endowment plan."

D. C. HALDEMAN, General Manager.

most favourably upon the scheme, that authority gave its sanction to the loan. Work was commenced on December 21, 1900, nearly a year ago. The station adjoins the swimming-baths and Corporation offices, with which it is in keeping in architecture. It was designed by and has been erected under the supervision of the borough surveyor at a cost of 7,551*l.*, exclusive of extras, though inclusive of the chimney shaft, which absorbed 1,873*l.* It will be remembered that the site was in the first instance, though admittedly convenient, objected to on the ground of the danger of the flooding of the works when the Medway overflows its banks; and to safeguard against this the floors have been raised 6 inches above the abnormally high flood level of February 1900, whilst the buildings below this mark have been made proof against water. The station comprises three blocks, and provision has been made for its extension towards the river. The centre block consists of the engine-room and the pit for the condensing plant; on the right are the accumulator-room, stores, workshop, testing-room, engineers' private and general offices; and on the left is the boiler house. The main entrance opens in the engine-room; a second entrance, facing the baths, leads to the offices. The station is well lighted, large skylights running the whole length of the roofs of the three blocks; and the entire interior, with the exception of the offices, is lined with white brick. Its exterior is of Rainham red bricks, with York stone dressings, and Kentish ragstone base below the plinths. At the apex of the centre gable are the borough arms carved in brick. There is direct communication from the engine-room, with the accumulator-room on the one hand and the boiler-house on the other; and the engine-room is spanned by a powerful travelling crane. Every precaution has been taken to exclude dust and dirt from the engine-room, the floor of which is laid with Venetian marble mosaic with coloured borders. The stokers will approach the pit by way of the boiler-house, which has been built to fit the boilers, with provision for their removal and replacing. The chimney shaft adjoins the boiler-house. It is 152 feet high, with a concrete base 30 feet square and a brick foundation 22 feet 5 inches square at the foot. The shaft is square 22 feet from the surface, and thence from a stone plinth is octagonal. There are two opening flues, one allowing provision for future extension. The shaft was built entirely from the outside, 1,000 scaffold poles being brought into requisition, and a lightning conductor has been attached. The contractors for the buildings were Messrs. G. E. Wallis & Sons, of Maidstone.

Provision for contingencies has also been made in the selection of the requisite plant. Four Davey, Paxman & Co.'s multitubular boilers, with an evaporating capacity of 6,000 lbs. of water per hour, each at a working pressure of 160 lbs. per square inch, constitute the steam generating plant. An emergency pump has been placed in the boiler-room for use in the unexpected eventuality of the flooding of the condenser pit. There are five steam dynamos, four 150-kilowatt capable of developing 240 indicated horse-power at normal load and 280 at overload, at 375 revolutions per minute, and one 75-kilowatt, capable of developing 120 indicated horse-power at normal load and 168 at overload, at 420 revolutions per minute. Heavy fly-wheels have been obtained in anticipation of a traction load; and a set of balancing transformers and battery boosters have been provided. The air and circulating pumps of the condensing plant are driven by a compound engine, water being obtained from the river. The switch-board, fixed in the centre of the north wall of the engine-room, is raised from the floor and approached by steps. The necessary instruments and switches are mounted on ten panels of enamelled slate carried on a steel angle frame with polished traction mould edges. The board is surmounted by an electrically-driven clock and two illuminated dial-feeder volt-meters. The accumulator, consisting of 280 chloride cells, is capable of discharging 100 ampères for five hours or 300 ampères for one hour; the latter would supply upwards of 4,000 8 candle-power lamps without aid from the dynamos. The distribution of electric energy is on the 3-wire continuous current system, explained in these columns at the time the mains were laid. Disconnecting and fuse-boxes have been placed at various points in the distributors for the purposes of testing and isolating. Mains have been laid, a total length of five miles, in the following streets:—High Street, King Street, Ashford Road, Albion Place, Sittingbourne Road, Holland Road, Broadway, Tonbridge Road, Terrace Road, St. Michael's Road, Rocky Hill, London Road, Buckland Hill, Week Street, Earl Street, Faith Street, Mill Street, College Road, Knight-riding Street, Lower Stone Street and Gabriel's Hill. High Street, Broadway, a portion of Tonbridge Road, Week Street, Gabriel's Hill, Lower Stone Street, King Street, Ashford Road and Albion Place will be lighted by forty-four Brockie-Pell arc lamps of 1,000-candle-power each, fixed on artistic standards. Earl Street and Middle Row will be lighted by incandescent electric lamps fixed on existing lamp-posts. The total amount of the contracts, exclusive of the buildings, was 28,733*l.*

MUNICIPALITIES AND HOUSING.

LECTURE was delivered last week by Professor Smart, of the University of Glasgow, on "The Duty of the Municipality regards Housing." The Corporation, he said, provides water, gas and cars, charging the consumers a price which covers interest, depreciation and sinking fund, so that the ratepayers feel no burden. Why not houses? Well, there is one difference. It provides all the water, gas and cars, but it cannot provide all the houses. The benefit conferred must be a sectional one provided with public money. Granting this—wanting also that the Corporation cannot "make the price" of housing as it does that of gas, that house-owning is always a risky business and that this particular kind of house-owning may show a loss—the argument is not convincing. Slums are not economical. Housing to supplant them is sectional, as the poor law is, to the recipient; to the community it may be a measure of public safety. We are mingling with the victims of the disease, drunkenness and crime. For the disease, drunkenness and crime engendered there we pay workhouse, reformatory, police-rates, hospital and law expenses. And we suffer in our labour supply, for good workers cannot be born and bred there. It would be easy to argue that, even if we lose money, it is in the purchase of a great national gain, and a municipality which dares to prove that such housing will "pay," take attention from the real point—Will municipal housing cure the evil? A second argument we are bound to face—that it will bring the municipality into competition with its ratepayers, the builders. But (1) this is a small class; it is not masons, bricklayers, &c., but their employers only; (2) the municipality is not going to take over the building trade, but only a section of it, warning the builders off this section. At any rate, in the circumstances this is not the time to dwell on abstract rights of individuals. Then, these two arguments be given up, and if the evil is as great as it seems proved to be, the municipality is not only bound to take up the problem in earnest, but if the remedy seem to involve a large scheme of building, the municipality is bound to build. For which class is it to build? For the slums contain two classes—the improvident, dissolute and criminal, and the decent poor who cannot find other houses at any price within their means. Any policy which deals with the slums deals with these two distinct classes. Hence the danger of a drift, beginning with the intention of clearing out the evil and ending in a socialistic scheme for housing everybody who

applies. If you do not take care the problem will run away with you. You feel bound to face the evil, but for want of defining what the evil is and is not, you drift into housing a class that does not need the special care of the municipality. That is why the economist deprecates those eloquent appeals to the heart that rouse impressionable people into frenzy and force municipalities into "doing something," when their first duty is to do nothing rashly. Thus it is that we have a drift when we ought to have a policy—sooner or later, of course, to be followed by a reaction and an undoing. The first step in the remedy is the clear separation in our own minds of these two classes, and of our duty to each. The second is segregation. On segregation all are agreed. But the Corporation proposes to segregate by housing the decent poor; those who think with me propose to segregate by building barracks for the dissolute. The one is ruinously costly, is beyond the strength of any Corporation, and in the end will merely shift the evil. The other will cure the evil, is a much smaller and less costly matter, can be done only by the Corporation, and yet will tax its energies to the full. The Corporation's position is not to be understood without doing justice to its history. It is naturally a great property owner, constantly acquiring ground by street improvement and building thereon. It has besides the heritage of the Improvement Trust; great slum areas cleared, then covered with paying properties. In short, the Corporation is not only already a great building speculator and property owner, but it is bound to go on. All this before it has even attempted the problem, the segregation of the decent poor. Of late, following the lead of the Workmen's Dwellings Company, which has proved that by selecting tenants and having resident caretakers such houses can pay 4 per cent., it has made a beginning. It has powers up to 100,000l., and its powers extend outside the city. With experience gained, a great staff, the experiments made, it is burning to begin. We are on the eve of another great drift. There is just time to ask the Corporation to change it into a policy, to count the cost, to tell us what they intend to do. Mr. Fyfe asks for 2,000 houses merely to relieve the overcrowding. Two thousand houses is a big order. But can it stop there? Has not the head of the municipality said that "the provision of houses for the poor has been definitely added to the work of the Improvement Trust, and is now perhaps its most important function?" Has he not, though ambiguously, spoken of a "right" of every poor man to get a Corporation house? Why

should the 7,000 people ejected from the ticketed houses get this privilege, and all the others be refused? But if the Corporation go on to house the whole of the decent poor, it will be the most gigantic task ever attempted by any municipality. But it can be done, if reaction and alarm at the load of debt do not stop it halfway. Perhaps, if there is no other way of it, it should be done. On one condition—assumed, but now to be made explicit—that these houses pay their way. It is dangerous doctrine, only to be justified by extreme danger and by success. But if the Corporation house the whole of the class, and do not go below cost, there is no necessary conflict with private interests, no privileged class, and no expense to the ratepayers except the burden of a huge debt. But if it go below cost it is not only losing sight of its problem—which was overcrowded slums and no place else for decent folks to go to—but it is entering on the most dangerous course known to history, giving a rate in aid of wages. Let me make this clear. People crowd into towns because of certain advantages, the chief being variety of employments and high wages. The inevitable high rent is the reflection of this. On the other hand, employers are constantly balancing the advantages of remaining in towns against building their factories in the country. The latter is most desirable. The most certain way to bring back labour to the fields is to give an alternative employment to agriculture. If employers are to remain in town they must pay high wages. But if a corporation gives houses under cost, it turns the scale in favour of the town, makes possible a lower wage, and still further depopulates the country. But, indeed, the outcry for good houses at slum rents is quite fallacious. A slum rent is nominally cheap, and we easily think that a house is not cheap unless let at a slum rent. Really it is dear. Give a man a bad house, among thieves and prostitutes; he spends his evenings at the public-house, and dirt, foul air and disease soon make him not worth a wage. That he is able to pay 2s. for a slum is a proof that he can pay more for a home, because he buys health, good neighbours, quiet at night, a future for his children. One thing more. It may be said, Why assume that there is no middle course, that the Corporation will be driven on to house the whole class? Why not experimental pioneer blocks? Simply because it is an experiment which cannot be followed. No other builder can sell at cost. In face of such competition building for this class must stop. To come now to the point, Will this great costly scheme cure the evil? To bring the whole house of cards to the

ground we have only to ask, What about the unselected tenants refused, of course, at the Corporation dwelling? If the slums are pulled down, or reconstructed a let—again to selected tenants—are the unselected tenants driven out of the city? Will they not find another locality and make it a slum—a hundred times worse now than the haven of good is taken away, and only bad tenants are left? Or if they are driven out of the city, are they further away than, say, Alexandra Park, which the Corporation thinks is enough for their decent tenants? That is to say, the Corporation which started out to remove a fruitful seed-bed of evil have simply housed a decent class, and left a concentrated evil in another place, as we used to clean the Clyde by emptying the mud on the shores of Dunoon. And what about the expense? It has not, indeed, fallen on the ratepayer directly unless the decent poor refuse to occupy the houses—but it has hung a huge load of debt round his neck. Now even a city like Glasgow cannot borrow indefinitely, and it must go on borrowing for many things besides housing. Is it not probable that some day, when it wants to borrow for some other large scheme, it will find that its estate is already mortgaged up to its borrowing limit? The other scheme has already been put forward by the secretary of the Workmen's Dwelling Company, Mr. John Mann. Recognising that enough houses must be built to allow the overcrowding laws to be put in force, let the Corporation build barracks—if barracks are good enough for our soldiers, they are good enough for this class of tenants, and specially constructed for the improvident and vicious—four bare walls, with a minimum of fittings to spoil, a little plaster and wood as possible; clean shelters, in fact. The tenant can easily turn them into homes if he likes—it is never landlords who build homes: if he does not like, he will turn a place into a pigsty. Here no questions are asked as to the applicant's past; only, weekly rents must be paid and strict rules observed—another kind of Corporation lodging-house, in fact. If the tenant will not conform, out he goes without mercy. The city has no place for him. Liberty of the subject. The only liberty I know is liberty under law. Law is the first condition of liberty. But how get the tenants into these barracks? Well, put in force the overcrowding law and who will go out? The bad tenants, for the landlord's interest is all for good tenants. Rejected at all good properties there is one home that will receive them, asking no questions. Then enforce the sanitary Acts on the slums. If this is not sufficient, buy up the slums and reconstruct them. The Work-

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

en's Dwellings Company has done it; private citizens have ne it; the Corporation can do it. Thus you segregate the deserving; make overcrowding and sanitary laws possible of enforcement; you do it cheaply, for you deal with a limited class; you give no foothold for imaginary "rights"; you do not interfere with private enterprise—indeed, you give it a fresh start. And you remove the seed-bed of evil so far as outside machinery can. If it be replied that the first duty of the citizens is not to the improvident and vicious, but to the decent or, I say "Yes," but to protect them, not necessarily to build them. Protection and police come first among the duties of a State; it is the duty that cannot be denied, for the State alone can provide it. In short, before planting pull out your weeds.

THE TRADES TRAINING SCHOOL.

On Thursday evening of last week at Carpenters' Hall Sir Michael Foster, M.P., distributed the prizes awarded to the successful students of the Trades Training School, Great Titchfield Street, which is conducted by the various City Guilds—the Carpenters, Joiners, Painters-Stainers, Plasterers, Bricklayers, and Wheelwrights. Mr. John Willson, J.P., Master of the Worshipful Company of Carpenters, presided, and the masters of the following companies attended, Messrs. Thos. Baker (Joiners), Arthur Spurling (Plasterers), Geo. Taylor (Painters), E. Marsland (Tylers and Bricklayers) and E. J. Wilkes (Wheelwrights), in addition to Mr Alfred Weston, J.P., Mr. J. C. Preston, Principal G. Carey-Foster, Professor Roger Smith (chairman of Trades Training School), Professor Henry Robinson, Mr. Keith D. Young and Mr. Alan Leale, assistant secretary, Board of Education.

In his able introductory address, Mr. Willson congratulated the students who had been successful in the examinations, and said that the work at the Trades Training School during the year had been of unusual excellence, which spoke well of the instructors. It was gratifying also to the Carpenters' Company and the companies associated with them, that the work which they have undertaken at Titchfield Street is so well responded to by the students, as it not only reflected credit upon them, but more than satisfied the promoters of the undertaking for the expenditure incurred.

Professor Roger Smith followed by reading his interesting report on the work undertaken at the Trades Training School, when the numerous prizes were presented to the successful

students. The certificates, medals, &c., gained at the Carpenters' Company's examinations in sanitary building construction and in carpentry, as well as in the architectural and building construction evening classes at King's College, were distributed at the same time.

EDINBURGH AND LEITH MASTER BUILDERS' ASSOCIATION.

THE annual dinner of the Edinburgh and Leith Master Builders' Association was held on the 12th inst. in the Royal British Hotel, Edinburgh. About 120 gentlemen were present. Mr. Robert Lamb (president) occupied the chair, and he was supported on the right by Provost Mackie and Treasurer Yooles, Leith; Mr David M'Arthy, architect, Edinburgh; and Mr. Hugh Nelson and Mr. Wm M'Neill, representing the Glasgow masons; and on the left by Bailies Telfer and Cameron, Mr. William N. Thomson, surveyor; Mr. Robert Keir, surveyor, Edinburgh; and Mr John Swinton and Mr. George Findlay, president and vice-president respectively of the Glasgow Master Wrights' Association. The croupiers were Messrs. P. Knox, Neil M'Leod and John Lownie. Among the general company were Councillor Forrest, Edinburgh; Mr. James Millar, Mr. Brotherston, house agent; Mr. Nicoll, secretary of the Edinburgh Builders' Association.

After the toast of "The King, Queen and Royal Family" had been duly honoured, Mr. Lownie gave "The Imperial Forces," and Bailie Cameron, in replying, said he was of opinion that General Buller had never got enough credit for the handling of the North Natal Forces. From the news they had received he thought they would see some fighting at Standerton and Ermelo, where Lord Kitchener had gone. He did not think we ever need anticipate conscription in this country. South Africa was no doubt a big continent, but it was, he said, too small for two flags, and only one flag, the Union Jack, could fly there. When the Dutch farmer learned the truth as to the issue of the war, we would have, he believed, a loyal and sound ally in the Dutch in South Africa.

The Chairman gave "The Lord Provost, Magistrates and Town Councils of Edinburgh and Leith," and in doing so complimented the members of these Corporations on the work they had done. Provost Mackie, Leith, in replying for the Leith Corporation, alluded to the friendly relations that existed between the two Corporations. Referring to the tram-

THE MAY-OATWAY FIRE ALARM

Licensed by H.M. Postmaster-General.

No greater fire loss than £10 has ever happened in any building protected by this system, and no one has ever been injured or lost. Whether the premises are occupied or not it is impossible for any fire to burn for more than a few seconds without giving its own alarm, and that at a period early enough to insure its suppression by half a dozen buckets of water. Approved by every Tariff Insurance Office and Fire Brigade in New Zealand, and solely used by the Government of that Colony for the protection of national property where the lives of inmates are concerned.

SIR EYRE M. SHAW (late London Fire Brigade),
Chairman.

way difficulty in Edinburgh, he said he believed that one of the causes of the present lessees of the Edinburgh tramways not being able to pay their rent was in consequence of the break at Pilrig, where thousands of pounds were lost yearly to the working company. One of the first things he did when he became Provost of Leeds was to attempt to get the state of matters at Pilrig put in order, but unfortunately the Leith-owning company, because their time for selling had not arrived, wanted too much money. He hoped that after the present troubles as to Sunday running of cars had passed away, they would meet together and endeavour to come to a satisfactory arrangement with regard to the tramways between the city and the port.

Baillie Telfer, in replying on behalf of the Edinburgh Corporation, at the outset referred to the illness of the Lord Provost. Alluding to the tramway question in Edinburgh, he said for the time the less said about it the better. He agreed with Provost Mackie that owing to the situation of the two communities the tramway communication between the two towns must be continuous, or it would never be satisfactory. Adverting to the question of the amalgamation of Edinburgh and Leith, he said he had no doubt that the time was not far distant when Leith would take over Edinburgh. Having stated that the expenditure of the city had been necessary to keep the city up to date, he referred to the old custom of contractors giving conveners gifts, and stated that some people were wicked enough to say the contractors wished a return for those gifts. Now he was of opinion that the contractors' motives were as honourable, more so perhaps, than the people who indulged in those insinuations. If the insinuation was made fair and square, he was almost certain they would give those people an opportunity of proving their case.

The toast of "The Edinburgh and Leith Master Builders' Association" was proposed by Mr. M'Arthy, who spoke of the good work the Association had done. He alluded to the proposal for a national federation of employers' associations and trade unions to cement between employers and employed the feeling of common interest, and stated that if such a proposal could be carried through, he believed it would be one of the best things that could be accomplished. Councillor Forrest replied, and expressed himself in favour of national union. He was opposed to town councils, county councils and school boards doing their own work. "The Scottish Building Trades Federation" was given by Mr. Thomas Lamb, and Mr. Alexander Drysdale replied.

Other toasts followed. At intervals between the toasts songs were sung, and altogether an enjoyable evening was spent.

THE WATER SUPPLY OF JERUSALEM.

THE inhabitants of Jerusalem are now provided with a sufficient supply of spring water for drinking purposes. The works, which commenced last July, as announced by the *Standard* at that time, were completed on the birthday of the Sultan (November 27), who issued the *Irade* for carrying out the scheme on the twenty-sixth anniversary of his accession to the throne, and water flows now copiously through the taps of the twelve fountains within the enclosure of the Haram. The Mosque of Omar (the site of the Temple of Solomon) and all from the fountain erected outside the city walls on the ancient Birket-es-Sultan (the lower Pool of Gihon), situated midway between the railway station and the Jaffa Gate.

The ceremony of the opening of the water taps in the mosque was performed by Djevad Bey, Governor of Jerusalem, assisted by the commander of the garrison, Rifat Pacha, and accompanied by all the functionaries of the Government, civil and military, attired in full uniform for the auspicious occasion. Speeches were delivered and prayers were offered for the preservation of the life of Sultan Abd-ul-Hamid, followed by shouts of "Padichahim chok Yasha" (Long live the Sultan). The same ceremony was repeated in the afternoon in front of the fountain outside the city walls above referred to, which the non-Mussulman population of the city can utilise, the "Infidels" not being allowed free access to the Temple area, or to share with the "Faithful" in the water conveyed to the Haram enclosure.

The new water-supply is derived from three tributary springs in the neighbourhood of the Pools of Solomon, to the south-west of Bethlehem, and distant about three hours from Jerusalem. The output of these springs previous to the devastation of the forests in the surrounding country was considerable, but at the present time the yield does not come to more than one to two gallons of water a second during the dry season, or about 90,000 gallons every twenty-four hours. The old stone aqueduct, which formerly from the time of King Solomon brought the water to the Temple area, was 25 kilometres in length, having been made to curve round the mountains, whilst the newly-erected aqueduct covers only

7 kilomètres. For the first six kilomètres—from the springs to Bethlehem—the water runs through clay pipes manufactured here, of 8 inches in diameter; and for the remaining 11 kilomètres the water is conveyed through wrought-iron pipes of 4 inches diameter, imported from Belgium. Before reaching the Mosque of Omar a branch conduit carries the water to the fountain on the Birket-es-Sultan, near the British Ophthalmic Hospital, to supply the inhabitants who dwell outside the city and who are precluded from partaking of the water coming to the Great Mosque. To shorten the distance, however, from the springs to the city, it was necessary to dig up a tunnel 1,460 feet long and 30 inches wide about a mile from the city. This tunnel, which is well-ventilated throughout, has been converted into a reservoir, and serves as a regulator for the distribution of the water.

The cost of the undertaking, amounting to about 8,000 Turkish liras, has been defrayed from the funds of the Evkaf (the Administration of Religious Foundations), and the works were most skilfully executed by M. George Franghia, chief engineer and head of the Technical Department in the Ministry of Public Works at Constantinople, who held the post of Government Chief Engineer in this city for many years, and had made special studies of the Jerusalem water supply question.

His Excellency, Djavad Bey, the present Governor of Jerusalem, has shown the keenest interest in the realisation of this eminently philanthropic scheme, which will allay the sufferings of many thousands of the poorer class of the inhabitants who could not afford to buy water when the cisterns are empty, and will no doubt contribute to diminish sickness from malarial fever caused by the dirty and unwholesome rain water collected in the cisterns.

THE COST OF BUILDING.

In a letter to the *Sussex Daily News* the Rev. V. A. Boyle, of Portslade, writes:—

Sir,—Your article on the Roman Catholic cathedral provokes thought. Cardinal Vaughan is not the only person who suffers from the increased cost of building. And it is difficult to see who is the gainer by it. Neither the public nor the workmen nor the contractor seem any the better.

1. *The Public*.—As ratepayers the public, and especially the poor, suffer from the enormous increase of rates due to the

great cost in erecting absolutely necessary public buildings. The East Sussex County Council is spending more than 300,000*l.* on its new lunatic asylum, the West Sussex County Council is spending even more. The Steyning Guardians' new workhouse costs some 65,000*l.* The Brighton School Board's new school is to cost 30,000*l.* All these buildings are necessary and must be built. I have no doubt that nothing has been sanctioned by the authorities erecting them which is not unquestionably required in each case. The public suffer in another way from the difficulty of obtaining houses, since building is now hardly remunerative. The results are high rents and overcrowding. Here again the poor are the chief sufferers.

2. *The Workmen*.—The workmen in the building trades are at the present moment being made the scapegoats for this state of things. And no doubt they have to bear their share of blame for bad work and for dawdling. But I should like to point out that they do not benefit by the increased cost. In the first place, there is no work to do. No one engages in building now who can possibly avoid it. And unless the cost is reduced there will be less and less building undertaken by private persons. But the workmen suffer in another way. Wages have not increased, so far as the individual worker is concerned, in anything like the proportion in which the cost of building has increased. The stonemason and his labourer are earning now no more than they earned in the fourteenth century. You speak of labour being then "obtained as a free gift to Holy Church." But in many cases there is evidence that ecclesiastical buildings were erected by regularly paid labour. The classic instance is that of the church at Oxford which serves the double purpose of the parish church of St John and the college chapel of Merton College. Exact accounts have been preserved of the actual cost of this building. Professor Thorold Rogers, in his "History of Prices," refers frequently to these and other accounts preserved by Merton College. The tower of the chapel, one of the most beautiful in Oxford, took three years in building, from 1345 to 1348. Such a tower could not be built nowadays for less than 5,000*l.* to 6,000*l.*, and would probably cost much more. Professor Thorold Rogers reduces the Mediaeval money to its modern equivalent, and the cost works out at 1,500*l.* The masons earned what was the equivalent of from 4*s.* to 48*s.* a week; they had an eight-hours day, and about the same number of holidays as their modern representatives. They were directly employed without the intervention of a contractor.

IRON CONSTRUCTION.
WOOD CONSTRUCTION.

There were no architect's fees; the foreman mason probably made the working drawings from his own design or that of his employers. In reducing Mediæval prices to modern, no account is taken of what is the workman's heaviest charge, house-rent; only the amount of foodstuffs and clothing materials are considered. The workman, therefore, does not gain by the increased cost of building. In the fourteenth century he enjoyed practically the same wages as at present, was directly employed, worked an eight-hours day, and produced work of a quality and beauty that is the despair of our times.

3. *The Contractor.*—It can hardly be urged that the contractor benefits by the present high prices. Small builders complain bitterly that, after working twice as hard as their own workmen, they make scarcely a better living. Big ones fill the columns of the *Times* with their lamentations.

Now, sir, as one of the public, I should like to know why building is expensive. Contractors tell me it is because of the cost of labour. Yet workmen earn no more than they earned in the fourteenth century. Are the men less efficient, needing more supervision and control? Or what is the secret? It is no use saying that wages have increased during the nineteenth century. They have, but they had previously decreased from the sixteenth to the eighteenth-century level. What I want to know is why is it not possible now to build a tower like that of Merton College Chapel for 1,500*l.*, and why ugly workhouses and lunatic asylums and elementary schools, with no pretension to beauty, are so terribly expensive? I ask the question feelingly, since in this parish the cost of enlarging the elementary school is pressing like a nightmare upon the school managers. The cost works out at half as much again as it would have been in 1898—that is, at 3,000*l.* instead of 2,000*l.*

A BELFAST BUILDING CASE.

In the Irish Chancery Division, before the Master of the Rolls, the hearing of the action of M'Connell and Stevenson v. Rober Wilson was concluded. Mr. M'Connell is a rent agent in Belfast, and Mr. Stevenson is an architect. The defendant is a builder and contractor, also carrying on business in Belfast. The plaintiffs sought an injunction to restrain the defendant from interfering with certain houses and premises at Fortwilliam Park and Skepniel, in Belfast, and the defendant counterclaimed for money which, he alleged, he had spent on

their erection. The case resolved itself into a question of fact. The defendant alleged that he had made a verbal arrangement with the plaintiffs to build the houses, and that he was to receive whatever amount they realised on sale after the cost of erection had been defrayed, and he claimed specific performance of that agreement. He also alleged that he had spent 1,100*l.* of his wife's money in their erection. The plaintiffs denied the agreement, and pleaded that they had advanced the money to the defendant to defray the cost of erection. They had frequently asked the defendant for an account, but could get no satisfaction. They claimed the property as theirs, and asked that they should be quiet in possession.

The Master of the Rolls, in giving judgment, said that the defendant claimed that he was owner of the lands as well as of the houses. That was a strikingly strange circumstance having regard to the fact that the plaintiffs were the persons to whom the land belonged, and also to the fact that it was their money which had erected the houses. There was no agreement between the plaintiff and the defendant as to the conveyance of the land, and how Wilson could claim it either in law or equity it was impossible to see. It was admitted by Mr. M'Connell that some kind of arrangement was made, and in regard to that matter his lordship wished to say that when a person of education like Mr. M'Connell and a business man like Mr. Wilson entered into such an arrangement it was simply a disgrace, and could not be characterised as a mercantile transaction at all—it was a disgrace that the arrangement referred to by Mr. M'Connell had not been reduced to writing. His lordship was plainly of opinion that the defence was no answer in point of law or in point of fact to the action, that the defendant had interfered with the property under some grotesque interpretation of his rights, and therefore there must be an injunction in the terms of the statement of claim. As regarded the counterclaim the matter stood in a different way, and if it were possible to take an account between the parties and close the matter his lordship would be glad to do it, but the counterclaim was founded entirely upon the same state of facts on which the defendant rested his defence. Therefore the counterclaim must also be dismissed. There was an open account undoubtedly between these parties, and Mr. M'Connell could not refuse to give an account of these houses when called upon. If there was anything over and above the amount of cost price of the houses after taking that account that must, of course,

long to Mr. Wilson. His lordship had nothing to do with the sums advanced by Mrs. Wilson. The injunction was accordingly granted and the counterclaim dismissed with costs.

ARCHITECTURAL SHAMS.

On the 14th inst. Mr. E. R. Taylor, head master of the Birmingham School of Art, distributed the prizes at the Nightingale School, Birkdale Park, Southport. In his address Mr. Taylor spoke of the value of drawing as a part of education. They learned to draw because it was a help to their studies, and another reason was that they might help to lessen the ugliness of to-day. Until about a century ago, he said, all things made by man, from buildings to articles for common use, had in them some element of beauty and fitness, and generally so much of rightness and beauty that the former could not be pulled down without protest, and the latter were treasured into museums. Looking at the two extremes of each, they must admit there were distinct lines of demarcation between beauty and ugliness. In architecture the manor-houses and cottages on the Cotswolds, or the half-timber work of Cheshire and Warwickshire, were things of beauty, and in contrast to most of the modern mansions and workmen's cottages. If they admitted that beauty and ugliness were not convertible terms it was worth while to inquire into the cause of so much of the present-day ugliness. When they looked at Turkey, India and Japan they would find that good work continued to be produced in these countries until recently. The work, however, was now contaminated by modern European influences, the same influences which had made our work in this country bad. Japan was the most recent and lamentable instance. It had hurried to adopt Western ideas of life, and its exhibit at the Glasgow Exhibition was the most melancholy sight there. One cause of this present-day ugliness was the attempt to revive old styles. The notion that we could bring to life dead styles was a misuse of the study of history, and yet it still prevailed. Another cause of bad work was the love of shams—not toleration only, but a love of shams. When he began work in Birmingham he found students and others on showing him their work generally checked the climax of praise by stating it was like something it was not. As an instance of this he cited the treatment of a stable wall which had a beauty of its own with its irregular

mortar joints, which gave a texture to secure which in other things great expense was often incurred. This was spoiled by ruling straight mortar joints at all angles to make it less like rubble-work. A final cause affecting all the others was the judgment by money value. This tainted all their work. In closing, he advised them in their pursuit of beauty to study simple and right construction, to study old work to see how it grew, to love nature, the source of all that was beautiful and to live simply.

ELECTRIC LIGHT IN YORK.

SINCE the York Corporation undertook the electric lighting of the city less than two years ago the results, says the *Yorkshire Herald*, of the venture have been closely followed. Doubts as to its success have been constantly expressed, and many of the critics are apparently still unconvinced of the wisdom of the Council when they decided to carry out the work themselves. The committee, of which Alderman Dodsworth is chairman, has had to face a vast amount of pessimistic criticism, due in some cases perhaps to want of faith in the new illuminant, and springing in other instances, no doubt, from a feeling that the undertaking was not likely to be of benefit to the city in the hands of the Corporation. It is not the aim of this article to prove that the critics were right or wrong, but simply to place before the public some facts from which they may draw their own conclusions. The electrical engineer (Mr. C. A. Midgley) has had charge of the work from the first, and he has supplied us with information which shows its growth since the opening of the power station on Foss Islands. To anyone who visited that station at the time of the opening ceremony the changes are sufficiently apparent. In the boiler-house a start was made with two Lancashire boilers, each capable of developing under forced conditions 400 horse-power. Since then two 500 horse-power water tube boilers have been added, so that there is now in the boiler-house a total of 1,800 horse-power. In the engine-room the original plant consisted of two small engines, each of 40 horse-power, which occupied a portion of the floor at one end of the building. To-day the whole area is covered by six high-speed engines, totalling up to 1,320 horse-power, whilst each engine can do 30 per cent. overload in an emergency. The two larger, one of which is not yet in use, are of 400 horse-power. Every inch of space is utilised, and the engine-room is a model of compactness. At the present time the evening load is about 1,000 horse-

power, and five engines supply the demand, whilst in the daytime one of the 130 horse-power engines runs the lamps in use up to two o'clock.

Every precaution is taken to guard against a stoppage of the supply from any cause, and no breakdown has occurred since the current was first switched on. During a temporary period of darkness caused by fog or thunderstorm, when the solitary engine is running smoothly along, the number of lights may in the course of five or ten minutes be increased from 1,500 to 12,000. The staff, however, is constantly in such a state of preparedness for emergencies that more engines may be started and the requisite current supplied in about a minute and a half. A new set of storage batteries is being installed having four times the capacity of the batteries now in use and weighing 80 tons. This accumulating apparatus when complete will render a stoppage all but impossible, for should engines and boilers break down it will carry the city through the heavy evening shifts without any fear of a failure of the light. In the first instance the committee put down plant to deal with 6,000 lamps of 8 candle-power. They felt, of course, that although they were confident of success, their undertaking was to some extent an experiment. The demand for the light fulfilled their most sanguine hopes, and by the time the plant was ready to start 4,780 lamps were connected. In order to meet the demand last winter engines were put in to supply 13,000 lamps, and the plant has been since increased as already described, bringing the capacity of the engines up to 21,000 lamps of 8 candle-power. Orders have come in with satisfactory regularity, and there are now 26,000 lamps connected and 6,700 awaiting connection. Mr. Midgley estimates that by the winter of 1903 the demand will reach 43,000 lamps, and under these circumstances it is necessary that the committee should be looking ahead. Important extensions are already planned, and should be completed by August next. A second engine and boiler-house will be built at the south-eastern end of the existing works, and it is proposed to put in three boilers of 800 horse-power each and two engines of 1,000 horse-power. The new building will be 100 feet in length, and the railway sidings will then bring the coal to the furnaces direct. The expenditure on these important extensions is estimated at 50,000*l*. Increased consumption usually means a decrease in price, and it is probable that the charges will shortly be revised in favour of the consumer.

In addition to 250 private consumers and the street lighting,

electrical power is now being supplied to several local firms. The committee would no doubt be glad to increase this class of customers, because, as a rule, the demand comes in the daytime, when there is ample power to spare. The number of consumers when the supply was commenced was only thirty-two, so that there has been a steady advance, and we are informed that no customer who has had the light installed has since given it up entirely. After paying the interest on the sinking fund and the working expenses, and discharging a debt of 300*l*. incurred in obtaining the provisional order and visiting other works, the committee made a profit of 98*l*. on the first year's working, and they look forward to increasing this for the second year. Mr. Midgley is not so one-sided as to claim that the street lighting is perfect, and his views on this subject are worthy of consideration. He thinks there was, in the first instance, a tendency on the part of the Corporation to over-estimate the power of the arc-lamp, and as a consequence the earlier ones were placed too far apart. As a result, when a light unavoidably blinks or jumps a little, the fact is far more noticeable because the next light is not close at hand to cover up its momentary deficiencies. He cites the lighting of Bootham, where the lamps are better spaced, as more nearly approaching the ideal. Mr. Midgley says that the whole of the streets could be lighted by incandescent lamps with a mean guaranteed candle-power of 50, saving the city 700*l*. a year. Chester, Leyton, Barking, Worthing and other towns are, it appears, lighting the whole of their streets with electricity, and Mr. Midgley, referring to the argument that the arc lamps have been removed in Sheffield, Leeds, Bradford and other towns, says that until very recently the power stations at Leeds and Sheffield belonged to companies, and Leeds has now decided to light many of the most important thoroughfares with arc lamps, whilst Bradford is considering a complete scheme of arc lighting. Although the cost of the arc lamps at present in use in York is from 50 to 60 per cent. more than was paid for gas, Mr. Midgley thinks that the greatly superior light is well worth the extra money. On the new scale of charges he calculates that the cost of lighting the city by gas would be 4,896*l*., and he informs us that the same candle-power could be supplied by electric light for 4,000*l*. Another use for the power may be found if an electric tram system is adopted, and if necessary a thousand horse-power could be supplied. Thus far, in comparison with other towns, York's electric-lighting scheme appears to have been a successful venture.

# ARMoured FIREPROOF DOORS

To the requirements of the Fire Offices Committee.

Can be fitted with Patent Attachment for Self-closing in case of Fire.

## LIGHTER & CHEAPER THAN IRON DOORS

Will not Buckle or Twist out of Shape.

WRITE FOR ILLUSTRATED CATALOGUE TO

### DOWSON, TAYLOR & CO. (MATHER & PLATT, Ltd., Proprietors),

14 Victoria Street, London; Blackfriars Bridge, Manchester.

# The Architect.

## THE WEEK.

THE Ulster Society of Architects was only lately formed, but it has already rendered excellent service to architecture by protesting against clauses which the Corporation are introducing in a Bill which will be brought before Parliament in the coming session. The following extraordinary clauses will make it plain that a system is proposed to be set up which will be intolerable to architects and fatal to architectural effect in Belfast. The part relating to elevations of buildings is as follows:—"Every person who proposes to erect or alter the front wall of any building shall, together with and in addition to the plan, section and notice which are required by the existing local Acts of the Corporation to be lodged with the surveyor, lodge in the manner and subject in all respects to the conditions prescribed by the said local Acts, a drawing or drawings showing all the elevations of such building overlooking any street or streets in which such building is proposed to be erected or altered. There shall be specified and shown on such drawing or drawings the height, character and design of the building proposed to be erected or proposed to be altered, and the height of any buildings immediately adjoining the same, and there shall be stated on such drawing or drawings the materials of which it is proposed to construct such elevations. The surveyor may disapprove of such elevations on the ground that they are in his opinion objectionable, or that in any respect they are not in conformity with the requirements or provisions of the existing Local Acts or by-laws of the Corporation. The provisions of the said Local Acts and by-laws shall, so far as applicable for the purposes of and not varied by or inconsistent with the provisions of this section, apply *mutatis mutandis* to the matters referred to in this section. Any person aggrieved by a decision of the surveyor as to such elevations may appeal to the Recorder of the City against such decision, whose decision thereon shall be final." At the present time there is a strong feeling against the surveyors of cities and towns undertaking the practice which belongs to private architects. But the sacrifices which are imposed by surveyors intercepting commissions are less onerous than would be the subjection to the surveyors if the law constituted them the sole arbiters of taste. The proposition is so absurd, especially with the Recorder as referee, that we fancy the clown in the Belfast pantomime must have inspired it.

It is understood that the Supervising Architect, Mr. TAYLOR, will seek for amendments in the Tarsney Act, which was passed to enable architects in private practice to carry out official buildings. From the short experience of the operation of the Act it is considered that the public interests would be better served if the architect's work was restricted to preparing the design, working drawings and specifications, leaving the realisation to the Supervising Architect's Department. The Secretary of the Treasury, who is responsible for building, cannot allow the architect a free hand and permit him to carry out alterations, although it may appear to him necessary. There are Government superintendents and inspectors who must be considered as constitutional officers, and their duties relate to buildings of all classes. As a consequence it is impossible to avoid friction between them and an architect who is called in for a single building. But it is thought that in all matters relating to construction, heating, ventilating and electric appliances the permanent officers are more likely to secure excellent work than the designer of the building. In other words, the endeavour is in America to restrict an architect's work to duties which can be carried out in his office.

WE recently described the difficulty which arose in Dorking in respect of a compound building which would serve for a post office as well as for municipal offices. The Post Office authorities approved of such an arrangement, but they could not have the building erected if a part was to be utilised for local purposes. The Local Government

Board, on the other hand, declined to sanction the raising of a loan for a building which would be partly used by the post office. The case was one of those conflicts between departments which are characteristic of the Government service in this country. LILY, Duchess of Marlborough, has come forward to rescue Dorking from a difficulty which appeared to be insurmountable. Her Grace has purchased a site for 2,400 $\frac{1}{2}$ %, and offered to erect a building which will serve as a new post office as well as Council offices. The Postmaster-General has agreed to take a lease of part of the premises for thirty years on terms similar to those previously arranged with the Council. A special meeting of the Urban District Council was held on Friday night, when the offer of her Grace to lease the remainder for a like period at 80% per annum was accepted. A vote of thanks was passed to the Duchess for the public spirit she had shown in the matter.

WHEN the Imperial Institute was started it was anticipated that much could be done towards improving the relations between the Colonies and England by means of the new agency, but it cannot be said that the Institute has been a great force in politics or in trade. It has therefore been decided to surrender the property to the nation. The PRINCE OF WALES presided at a meeting on Saturday last for that purpose. Lord JAMES OF HEREFORD, as chairman of the executive council, made a full statement of the position of the Institute. He stated that its financial position was most satisfactory, and that its property was worth some half-million of money. The present policy of the management was to improve our commercial action through the Institute's commercial intelligence and scientific research departments. The Institute, however, was now acting in directly the same path and the same field as the Board of Trade. The two bodies had founded similar advisory committees, with the same objects and appealing to the same interests. Resolutions were unanimously adopted approving of transferring the Institute, with all its property, to the nation. The Chairman afterwards announced that the policy of transfer met with the entire approval of His Majesty the KING, who was its founder, and had always personally taken a most active share in the management of the Institute. There is no doubt use can be made of a special building for Colonial purposes, but it has yet to be discovered what arrangements will be mutually satisfactory to the people in British colonies as well as to the people in this country.

IN one way it is satisfactory to learn that the Hill of Tara when put up for auction last week could only attract two bidders. The amount offered was judged insufficient, for it did not reach 3,000 $\frac{1}{2}$ %, and the farm is therefore in the market, and may be acquired by the payment of the sum which represents its agricultural value. Why we have said there was some satisfaction at the failure is that a purchaser might be attracted in the expectation that archaeological objects would be found of immense value. The large Celtic brooch known as the Tara brooch, which has been so often reproduced in various forms, has excited Irish imagination, and it is generally believed a great many, at least equally beautiful, remain lying under the soil. There are supposed to be even greater treasures, for not long since some enthusiasts who had traced the Ark of the Covenant to the place endeavoured to seek for it regardless of the regulations for the preservation of antiquities which are in force in Ireland. MOORE'S song about the harp that once through Tara's halls the soul of music shed has led people to conclude there must have been an immense building in which the numerous Irish kings and their councillors used to assemble periodically. But the banqueting-hall, the council-chamber, and the other parts which bear resounding titles were little more than enclosures, of which the remains are interesting as late examples of earthwork construction rather than of building. It is possible harps sounded on Tara, speeches were delivered, and justice was administered there before an immense assemblage of men clad in raiment dyed in primary colours, but the scenes were enacted in the open air, and not in roofed buildings.

## THE GERMAN EMPEROR ON ART.

**M**ONARCHS in modern times have so much to occupy their attention, it is only on especial occasions, such as the opening of an international exhibition, that any recognition of art is vouchsafed from their lips. The address which was delivered on the 18th inst. by the German Emperor at the banquet to the sculptors who co-operated in representing the old Hohenzollern chiefs in the Avenue of Victory of Berlin is, therefore, deserving of consideration. There is no doubt the KAISER is an orator, and his speech should be judged, in the first place, by its effect on his auditors. A foreigner can hardly be able to appreciate many points or expressions which exert an influence over Germans. The continual reference to himself may, outside the German boundaries, suggest the "Alone I did it" of CORIOLANUS, or the "L'état c'est moi" of LOUIS XIV. A German, however, is able to discriminate and will accept the words as savouring of affection rather than of arrogance.

There is not any reason why the KAISER should not be inspired by pride of race. Success counts for much in this world of ours, and the Hohenzollern family have been able to advance to heights beyond all their competitors in Germany or Europe. For over a thousand years the family has existed, and to advance from a count to an emperor means the possession of extraordinary qualities in a succession of representatives. Why should not the Emperor suggest to his subjects in Berlin, and to all visitors to the capital, that he was following a line of distinguished predecessors who had won their way by manly vigour? There are wise people who consider the present should monopolise all thoughts and that the dead past should be left to bury its dead, but the German mind is retrospective, and for that reason the most laborious historians have been Germans or have been inspired by German examples. The historiographer of the Hohenzollerns, Professor KOZER, has collected abundant information about the personalities of the chiefs, as well as about those who aided them in their labours. It is never ignored that the electors of Brandenburg and kings of Prussia were well served. The great memorial of FREDERICK THE GREAT which is in Berlin does not present simply the warrior himself. His generals and men who were eminent in peaceful pursuits were introduced as part of the composition. The most characteristic statue of EMMANUEL KANT which sculpture has produced is to be found as one of those accessories. The figures which appear around the Hohenzollern chiefs in the Avenue of Victory may have less authenticity as portraits, but they are at least suggestive of the principle that in Prussia public services are always recognised. It is preferable to see imaginary portraits of men who once existed than allegorical figures of supposititious qualities like those which used to accompany the statues of French kings.

Having obtained a definite idea of his project, and finding that research was able to suggest some of the peculiarities of his ancestors, the next step of the Emperor was to have the idea realised. His description of his negotiations was characteristic. A German prince generally avoids the stand-off manner with artists and authors which is supposed to be necessary in other countries. GOETHE, at the time when he was recognised as the most illustrious writer in Europe, was not ashamed to acknowledge that he owed to the Grand Duke of WEIMAR not only affection and confidence, but fields, garden and house, and the affability of the Duke and his Duchess was known to all in Weimar who had any pretensions to art and literature. This national quality was also exhibited by the great FREDERICK, although it took a wrong direction, for his favours were bestowed mainly on French authors, French painters and French sculptors. It was for that reason SCHILLER claimed independence for German poetry, for as it was driven from FREDERICK'S throne it went to the people for support. The third German Emperor is not ambitious to become a patron of foreigners, for he believes, as he said in his speech, "that the most favourable auspices for the solution of a problem in art are not to be found in convoking commissions or in instituting all sorts of prize juries and competitions, but rather by following the old and approved methods of Classical times and also of the Middle Ages—through

direct relations between him who gives the order and the artist—a method which furnishes a guarantee for a favourable development of the work." His Majesty also considered it wise that in producing statues under a royal command the sculptors should be free from all dictation that would affect their independence as artists. General instructions were given, but in all other respects there was the fullest liberty, "not merely liberty in regard to combination and composition, but, above all, liberty to put into their work that element of themselves which every artist must contribute if he is to give his creation the stamp of his own individuality. For every work of art always implies some particle of the individual character of the artist." The Emperor is satisfied with the success of the sculptors' work, and is of opinion that the Berlin School of Sculpture could hardly have been surpassed at the time of the Renaissance.

As the new museum in Berlin containing examples of Greek sculpture acquired by recent explorations was opened on the day of the banquet, the Emperor seized the opportunity to speak of Classic art and compare it with some varieties of modern art. Every educated German can always discourse about the art of antiquity and the influence of idealism upon it. Once it was said with some truth that if England held dominion over the waves, Germany was supreme above the clouds. Now there is a belief that German warships would be able to hold the seas against all opponents, and in commerce and manufactures Germans are also prominent. But there is still a weakness remaining for the ideal, not merely in art and literature, but in politics and sociology also.

In Classic art the Emperor sees the constant sway of the law of beauty, the law of harmony, the law of æsthetics. The highest praise that can be given to a modern work of art is, he says, to describe it as "nearly as good as if it had been executed nineteen hundred years ago." Among all the arts, sculpture, according to the KAISER, is the freest from modern tendencies and movements, and is therefore exalted and sublime. It should be kept in its pure state, regardless of criticism and the variations of theories, otherwise it would become a manufacture, an industry rather than an art. Liberty in art is as objectionable to the Emperor as liberty in speculations about government. He expressed this when he said:—"With the much-misused word liberty and under its flag people often land in lawlessness and license and in overweening self-conceit. Whosoever forsakes the law of beauty, the sense of æsthetics and of harmony which appeals to the heart of every one, whether he can express it or not; whosoever regards as more important the idea of a special tendency, of a particular solution of problems which are mainly technical, that man is sinning against the well-springs of art."

If an artist can produce a figure that is superior to any natural production he is to be praised, but without exercising his liberty as an artist for that purpose by departing from nature, he would never have attained what he sought. If POLYCLETUS accepted the law of beauty as laid down in the works of his predecessors, his *Doryphorus*, or whatever other work became the "canon," would not have been created. Apparently he was as indifferent to respected laws of æsthetics as to the forms of any of the individuals he employed as models. The Greeks did not believe POLYCLETUS was to be the only law-giver, for we know that PHIDIAS and three other sculptors were brought into competition with him. If afterwards the civil authority compelled artists to adopt the canon of POLYCLETUS as the model of beauty, the figures produced would not deserve to be considered as works of art. But the Greeks allowed liberty, for they could discriminate between it and license.

Apparently the Emperor, when praising sculpture which resembles ancient Greek examples in remoteness from ordinary life, was thinking how much easier the government of a modern State would become if the poorer classes took delight in Apollos and Venuses, and avoided representations which recalled their own condition. According to the Emperor, "it is the business of art to co-operate in exercising an educative influence upon the people; it ought to aim at furnishing the lower orders as well as others with the opportunity, after hard labour and toil, of upraising themselves again by the aid of ideals. For us—for the German people—great ideals have become permanent possessions, while other nations have more or

less lost them. If art, as is often the case nowadays, does nothing but depict misery in a guise even more hideous than the reality, it is sinning against the German people."

If it could be accepted that an artist is to be deprived of liberty to reflect and to record what he sees, and in Germany especially should confine himself to the representation of myths, then, of course, all the realistic pictures of life in German cellars and garrets would be contrary to official æsthetics. But the true meaning of the word æsthetics is to perceive, and there is an end to art if men cannot express what they look upon in the way which their nature prompts. The artist, it should be remembered, is the child of his time. When people in general believed misery to be only a preparation for happiness in another world, artists were content to represent every variety of it. There were paintings and statues of martyrs, beggars and pilgrims, and we may assume that the sight of those types gave some satisfaction to the sufferers who looked upon them. But the day has passed for work of that kind to be medicine to the mind. People are now puzzled at the presence of the wretchedness which exists in the world, and although they may not be all resolved to make sacrifices to alleviate it, there is no doubt the selection of such subjects somehow interests a large class of spectators. In all such things artists and ordinary men seem to be unable to resist an influence which they cannot describe, but which prevails. It is the spirit of the time, and is not to be overcome by prohibition.

The Emperor of Germany was also severe upon those artists who endeavour in various ways to advertise themselves. We have great respect for the Emperor, and therefore we have no hesitation in saying that the KAISER himself is indebted for the unique position he occupies in the world to the peculiar and mighty power which he condemns. This is an advertising age as well as a realistic age, and a man who is indifferent to the efforts of friends and the Press to exalt him is bound to remain unknown, and in our time that means failure. To say, as the Emperor did, that in ancient Greece or in Italy in Renaissance times no great artist ever had recourse to the self-advertisement which is now practised in the Press is simply to forget that different ages have different characters, and that the condition of no country nowadays corresponds with that of Ancient Greece or Renaissance Italy. What is the Avenue of Victory but an advertisement of the great house of Hohenzollern, which it is expected will reflect credit on future Emperors? The impression which the long lines of marble warriors and legislators make upon foreigners was stated to be quite overpowering, and it was courteously added that they created respect for German sculptors. It could also have been mentioned that so many ancestral figures compelled strangers, and especially those from England, to form a higher notion of the antiquity of the rulers of Prussia than was derived from school books.

There is one satisfaction which most Germans will have in the address, and that is the suggestion it conveys that the Emperor is a student of SCHILLER. Over a century has elapsed since the poet anticipated the imperial orator by saying in figurative style that the German artist should be torn from his mother's breast and fed on the milk of a better age. He was to grow in the climate of Greece and to return to Germany like the son of AGAMEMNON, terrible in austere power, in order to purify his country. From Greece he was to take the form of his works. He was to avoid a discontented spirit and to keep away from the province of reality. The corruptions of his time were to be despised, and he was to look upwards for his dignity and his mission. When writing in that strain SCHILLER was expressing his own fervid aspirations. It is through his love of idealism that he remains the poet of young and ardent natures in Germany. But SCHILLER could not keep the world from varying as it grew older. The state of thought in our time proves that GOETHE was the better prophet, for he endeavoured to convert his friend to realism, which he with his marvellous insight perceived was impending as a motor force over human thought. In his exaltation after the completion of the Avenue of Victory the Emperor of Germany naturally adopts SCHILLER'S view of the duties of artists, but a further experience of life may convince him that figures in the Greek style are no consolation for people who are badly clothed and badly housed.

Art is not served by assigning to it an office for which it is not competent, and stone, although beautifully wrought, is no substitute for bread with the hungry.

### THE SIBYLS IN ART.

VISITORS are occasionally puzzled when, on entering the Sistine Chapel, they perceive that MICHEL ANGELO had introduced figures of sibyls as if they were of equal importance with the Hebrew prophets. In England the word "sibyl" has several acceptations. But every one does not realise from the definitions the motives which induced the Florentine artist to employ five representatives of the visionary women as elements of the most important example of church decoration which exists. In "Othello" we are able to see the Elizabethan interpretation of the word. The Moor, in describing his handkerchief, says:—

A sibyl, that had number'd in the world  
The sun to course two hundred compasses,  
In her prophetic fury sew'd the work;  
The worms were hallow'd that did breed the silk;  
And it was dyed in mummy, which the skilful  
Conserved of maidens' hearts.

The words were written about a century after MICHEL ANGELO had undertaken the commission to adorn the Sistine Chapel, and they reveal a great change in European thought. The Shakespearean Sibyl is simply a witch who produces fatefully dangerous cloth; whilst to a Roman the sibyls were precursors who prepared men's minds for the coming of the Divine Founder of Christianity, and, like the herald angels, proclaimed the festival we are now celebrating.

As far as we can judge, the ancient traditions do not uphold SHAKESPEARE'S view of the business of a sibyl. They were all believed to obtain their information through the inspiration of some deity. Long before Greeks and Romans had given attention to them they were revered as prophetesses in various part of the East. Some, indeed, retained names which indicate the region in which they acted. The number was limited. According to VARRO there were ten, viz. the Persian, the Libyan, the Delphic, the Cimmerian, the Erythrean or Babylonian, the Samian, the Cumæan, the Hellispointian, the Phrygian and the Tiburtian. At a later time it was believed there was only one sibyl who had written ten books, and, according to other accounts, all the prophecies were contained in three books. Some were supposed to be more closely connected with Christianity and Rome, and that may suggest the reason why MICHEL ANGELO introduced only five sibyls in the Sistine Chapel.

The inspired writings of the sibyls were not all forthcoming, but from time to time reference was made to some of them. In the Isle of Delos there was a hymn to APOLLO which PAUSANIAS preserved, which was believed to be the composition of the Erythrean Sibyl, who was honoured not only in Delos, but in Samos, Delphi and Claros. The inscription on her monument was copied by PAUSANIAS. It might be imagined that the same sibyl appeared under different names, for the Persian was sometimes known as the Chaldean or the Hebrew. She bore the name of SAMBETH, and was a daughter-in-law of NOE. The Cimmerian may also be identified with the Italian.

The most important in a historical sense, and without any reference to the relation with the Hebrew prophets, was the sibyl who offered prophetic writings to TARQUINIUS SUPERBUS. She brought nine books. When the king refused to buy them she destroyed three; then she asked the king an equally high price for the six; on his again declining she burnt another three. Still demanding the same price for the three as for the nine, the king's curiosity was excited and he purchased them. VALERY, the French king's librarian, visited the grotto at Cumæ where the sibyl had lived; but when he found it was necessary to have not only torch-bearers but to descend on the back of a guide into a dark and muddy cavern, his courage failed him. His experience in Paris made him believe that the transaction did occur, but he thought the sibyl should have asked for a still higher price for the three last volumes, since that was of the custom in dealing with modern book-

hunters, who were of the same character in all ages. NIEBUHR, the historian, accepts the tradition seriously, and says the Sibylline books were written in Greek, and were derived either from Ionia or from Cumæ in Campania. They were deposited in a stone chest in a vault under the Temple of Jupiter Capitolinus at Rome, and were only seen by the officers who had charge of them. NIEBUHR's conclusion, from what is said by LIVY, is that the original books were not consulted to obtain information about the future, but simply as ritualistic guides when war or plagues fell upon Rome, in order to ascertain whether all that had been ordered was observed in the service of the gods. When the temple was destroyed the books were burnt, and ambassadors were sent through Italy, Greece and other places to discover similar oracles. Probably in consequence of the mission many manuscripts or Sibylline leaves came into possession of Roman citizens, for even in such important affairs a demand always creates a supply. From their vast number the authority of the leaves as oracles declined. Owing to this cause the Emperor AUGUSTUS ordered that all the versions in private collections should be destroyed, and it is recorded that no less than 2,000 were burnt on one occasion.

The interest of the Sibylline books was not confined to the worshippers of the gods of Rome. In the earliest Christian writers there are indications which suggest their belief in the prophetic power of the women, especially when it related to the coming of CHRIST. The Cumæan Sibyl was especially privileged. Several of the ancient Fathers of the Church speak of the sibyls reverentially. CONSTANTINE, it is said, somehow obtained possession of eight books by the Erythræan Sibyl, and in one place the first letter of a series of lines when treated as an acrostic formed the words "Jesus Christ, Son of God. Redeemer. Crucified." There was much else which was believed to be mysterious, and which, however, corresponded with what took place in Bethlehem and Jerusalem. In consequence a whole literature was gradually formed in Mediæval times around the sibyls. The great philosopher, THOMAS OF AQUIN, maintained in his principal work that the possibility of believing had been offered to the heathen in the old days through the sibyls. There are references to them in hymns which were long used in most of the Christian churches, one being the familiar "Dies Iræ," which begins:—

Dies iræ, dies illa,  
Solvat seculum in favilla,  
Teste David cum Sibylla.

Some modern translators are, however, afraid to join the Hebrew king with a pagan woman, as in the following version by CLARENCE MANGAN:—

The day of wrath, the day of woe,  
Shall lay the world in ashes low:  
As David and the seers foreshow.

In many recent hymn books, DAVID, as well as the sybil, is ignored, and THOMAS OF CELANO's sequence is paraphrased out of recognition.

It is not necessary to discuss the value of any sibylline announcements which are supposed to bear upon the new era in religion. Christianity can dispense with them. But it is easy to realise the satisfaction of Renaissance artists with subjects which could bring them into connection with antiquity. It is hardly to be expected that painters and sculptors will look upon doctrines in the same way as professed theologians, and we may be sure that RAPHAEL was delighted when he was enabled in his great wall-paintings in the Vatican to introduce figures of several famous pagans. Opportunities of that kind were necessarily rare. The sibyls could, however, be considered almost as pre-Christians, whose testimonies were of incomparable importance. The story that AUGUSTUS, under the influence of the Sibylline leaves, had erected an altar in the Capitol with the inscription "Hæc est ara primogeniti Dei," was enough to make people think that reference to the sibyls in any way was not only allowable but advantageous. The circumstance also that the number of sibyls was, according to some traditions, twelve instead of ten, easily supported the theory of a connection between them and the Apostles.

It does not appear that sibyls were found in any of the paintings of the Catacombs. But their absence can be

explained by a recollection of the necessity to uphold Christian doctrine without the aid of anything which might be thought adventitious. The early believers cared little about the ordinary laws of evidence. It is, however, supposed that some of the female figures in very ancient mosaics may represent the prophetesses. The old church of Araceli in Rome is by some archæologists held to stand on the site of the Temple of Jupiter Capitolinus, and it contained a mosaic in which the LAMB was placed between figures of the Blessed VIRGIN and the Emperor AUGUSTUS, and was therefore a commemoration of the Augustan legend which we have mentioned above. It is also known that at a later time one of GIOTTO's pupils painted a fresco in the tribune of the church in which not only AUGUSTUS but the Cumæan Sibyl were introduced. The same sibyl is met with in various early illuminated manuscripts. It is also remarkable that the subject was admired by artists who lived at a distance from Italy. JOHN VAN EYCK is stated to have painted figures of the emperor and the sibyl in a picture for the church of St. Martin at Ypres. An old altar-piece in the Berlin Gallery, which is ascribed to HANS MEMLING, as well as to ROBERT OF BRUGES, also shows the emperor and sibyls as spectators of the adoration of the three kings. The combination was a favourite one in Italy, but as there were more associations with the sibyl and the emperor in Italian States than in the Low Countries, the arrangement is less surprising.

One or more sibyls can be seen in the paintings by GHIRLANDAJO in one of the chapels of the Church of the Trinity at Florence. Their figures are also in the paintings by PERUZZI in Siena. In the chamber of the Segnatura in the Vatican, PIERINO DEL VAGA introduced AUGUSTUS as well as the sibyl, and similar figures were produced by GAROFALO and PERUGINO. GHIERTI used sibyls as part of the decoration of his bronze doors in Florence. More inexplicable in one sense is the appearance of the twelve sibyls in the chapel at Loretto, where they are arranged as pendants to the Prophets.

It would now seem from figures of the sibyls forming the principal decoration of chapels that they served instead of patron saints. DIDRON, the archæologist, says that such a chapel formed part of the church of St. Jacques at Dieppe, but we believe the twelve figures were merely intended to be ornamental. There are statues of ten sibyls of white marble in the cathedral of Siena; they are superb examples, especially the Erythræan Sibyl, which is by ANTONIA FEDERICHI, who largely aided in the adornment of that most interesting building. There are nine sibyls in the cathedral of Ulm, and the figures are to be found in several of the German Mediæval churches.

When MICHEL ANGELO introduced the sibyls in the Sistine Chapel he was adopting a tradition which, as it were, received the highest official sanction from the position of his paintings in the Papal chapel. In a decorative sense they are secondary to the subject-paintings, but the single figures are declared by many competent judges to be of as much importance as any of the larger works. Whether it was owing to the arrangement of the building rather than to a selection of the most important sibyls in a doctrinal sense that restricted MICHEL ANGELO to no more than five is not determined. Those painted are the Persian, Erythræan, Delphic, Cumæan and Libyan. They differ in age and bodily vigour and are sculptural in treatment. They all are represented as engaged in earnest study of books, as if the artist wished to suggest that their testimonies to Christianity were derived from ancient traditions. All are admirably executed and well deserve the praise lavished on them by artists since the time they were first seen. RAPHAEL never showed more courage than when at the suggestion of AUGUSTINO GHIGI he painted four sibyls in the church of Santa Maria della Pace. The four selected were the Persian, Phrygian, Cumæan and Erythræan. Instead of depicting them as reading from books, RAPHAEL suggested that they were writing at the dictation of angels, and on the tablets which they bear are inscriptions relating to Christianity. MICHEL ANGELO is said to have shown not the least jealousy of his rival, and he told GHIGI that every one of the heads was worth a hundred crowns.

Among the numerous representations of the sibyls which have been produced, those by MICHEL ANGELO and RAPHAEL must always be regarded as the most important.

The attempts which were made by later artists suggest that the value of the sibyls as witnesses to the truth had declined, nor is there ever a likelihood of a revival of interest in them. The figures now selected for subjects in church decoration are of a different character, but in the present season we may be allowed to again glance at subjects which at one time were dear to artists. In our time it is possible to admire ancient art with all our power without incurring a suspicion of paganism, but in old days, when churches were not only the picture galleries of the people but the libraries also, it was necessary to be careful in dealing with subjects which could not be looked upon as entirely ecclesiastical. The sibyls were an exception, and as long as they were to be seen it could not be said that antiquity was altogether ignored. Whatever was the value of their prophecies, they seemed as a binding link between diverse elements, and on that account their interest should be enduring.

### EXCAVATIONS AT STONEHENGE.

AT the meeting of the Society of Antiquaries of London on the 19th inst., Mr. W. Gowland read a paper on "Excavations at Stonehenge." In his opening remarks he mentioned that he was employed during September last in superintending the exploratory work in connection with the leaning stone at Stonehenge. He could assure them that the stone had been made safe, he believed, for all time. After describing the operations of raising it to its perpendicular and giving in detail the composition of the different layers which were found, he said that the excavation was carried down to a depth of 8 feet 3 inches below the datum line. He then proceeded to a consideration of the objects found in the excavations. They comprised chippings and lumps of the stones, stone tools, bones, a few coins and fragments of pottery. The chippings and pieces of stone were those which had been detached from the stones during the operations of shaping and dressing, and were found in very large quantities. All the varieties of rock of which the stones consisted were represented. Nearly 100 stone implements were excavated, and Mr. Gowland divided them up into the following classes:—Axes, hammer axes, edged hammer stones, stone hammers and mauls. With regard to the uses to which they were applied, he said it was evident that they were used not only for roughly breaking the rude blocks into regular forms, but also for working down their faces to a level or curved surface. Those rough implements could, he thought, notwithstanding their rudeness, be legitimately placed in the Neolithic Age. With regard to the bones, they were only those of domestic animals, and could not afford any evidence as to the date of Stonehenge. The coins found were of a very miscellaneous character, and all were found in the superficial layers. The excavations had yielded sufficient, he said, to make clear generally the manner in which the operations of working and erecting the stones were carried out, but they threw little light as to the transport of the blocks. For the solution of that problem they had to turn to the examples of similar work in countries such as Japan. He went on to describe the supposed methods of shaping and dressing, and said that the finished surfaces of all the stones exhibited very careful tooling. He next considered the manner in which the blocks were set up and secured in their foundations. As to the most massive stones in the structure, the recumbent stone and the hitherto leaning stone, which formed the piers of the central and the greatest of the trilithons, the excavations had afforded clear and conclusive evidence. The foundations were prepared by cutting away the chalk rock in such a manner as to form a hole about 8 to 10 feet in depth, leaving an almost perpendicular face on the south-west side to form a buttress against which the back of the stone was to rest. From the bottom of the hole an inclined plane of rock sloping down from the interior of the enclosure was apparently cut. Both the rubble and chalk were also dug away for a considerable distance north-west, and to a depth of 4 feet on the south-west. The hole was then filled to a depth of 3 or 4 feet with white chalk rubble to form a layer in which to embed the pointed base of the stone and thus afford greater stability to it. The stone was then slid into the hole and gradually raised into a vertical position by means of levers and ropes. As the stone was being raised it was packed up with logs of timber, and probably with blocks of stone placed beneath it. After its upper end had reached a certain elevation, ropes were attached to it, and it was then hauled into a vertical position so that its back rested against the face of the chalk. Two blocks of sarsen were afterwards placed under the oblique side of the base; the excavation was filled in with rubble. After describing the erection of another stone

Mr. Gowland proceeded to prove that the blue stones and the sarsens, the stones of Stonehenge, were contemporaneous. He had come to the conclusion that, until some bronze implements were found, Stonehenge was erected during the latter part of the Neolithic Age, the period of transition from stone to bronze and before that metal had passed into general use. He was, he thought, fully supported by the evidence afforded by the excavations. The purpose for which Stonehenge was erected was not a sepulchre, but a place of sanctity, dedicated to the worship of the sun. The idea of the origin of megalithic structures from a common source had been advanced by many writers, but in that connection it should be borne in mind that there seemed to have been an epoch in the life of many races, widely separated from one another, during which, under varied conditions, they erected monuments of more or less rude megalithic blocks and of similar forms. From that it by no means followed that the practice or the forms were copied by one race from another, but rather that they were the outcome of a similar development of the human mind and had an independent origin in many and remotely separated regions. In Britain there was abundant evidence, in the numerous rude stone monuments distributed throughout its area, that that peculiar phase of mental development had reached a very high point. Why then should they seek in distant countries for the origin of their crowning example of megalithic art? Of its foreign origin there was, in fact, no proof, and its plan and execution alike could be ascribed to none other than our rude forefathers, the sun-worshippers of the Neolithic Age.

### THE LATE E. W. SMITH.

MR. EDMUND WILLIAM SMITH, M.R.A.S., archaeologist surveyor of the North-Western Provinces and Oudh, died of cholera at Mohinpurwa, Bahraich, while on tour there on November 21, in his forty-fourth year. According to the *Times* he joined the department as assistant architectural surveyor in 1886, and in that capacity made a detailed examination of the Mogul architecture of Fatehpur-Sikri, the ruined capital of Akhbar, the results of which were embodied in four handsome folio volumes, illustrated with photographic plates and issued under the orders of Government. A handbook based on this *magnus opus*, to be illustrated with a few selected drawings, and designed to meet the needs of travellers and others not able to give the architecture of Fatehpur-Sikri very detailed study, was one of the unfinished projects Mr. Smith had in hand at the time of his death. Another of his published works deals with the China-ka Rauza, a building to which exceptional interest and beauty are given by the exterior coating of rich tiles worked into innumerable designs. Mr. Smith succeeded Dr. Furber as the provincial head of his department and curator of Lucknow Museum in 1898. Before Lord Curzon called attention to the responsibilities of the Indian Government in respect to the ancient buildings of the country Sir Antony MacDonnell had adopted a liberal policy towards the archaeological department in the provinces he ruled; and under his directions Mr. Smith accomplished a great deal during his all too brief tenure of the appointment in the restoration and conservation of ancient buildings. The famous Taj Mahal at Agra received special attention, and in executing the delicate restorations required Mr. Smith called into activity a vein of latent indigenous talent with excellent results, many of the artificers engaged claiming to be descended from those who were employed by Akhbar and Shahjehan. The squalid surroundings of the approach to the Taj, noticed by many travellers, have been removed by the conversion of the barren ravines and huts lying between that "dream in marble" and the fort into a public park. Restoration on an extensive scale has been conducted by Mr. Smith at Fatehpur-Sikri, and the more important ancient buildings of Allahabad, Lucknow, Fyzabad and Bahraich were also repaired. A portfolio of architectural drawings, intended to influence for good Indian designs and workmanship by a return to ancient models, was in course of preparation by Mr. Smith. The North-Western Provinces are exceptionally rich in beautiful architectural memorials of the past, and it is a misfortune to the cause of archaeology in India that Mr. Smith should have passed away with so much work for their conservation unfinished.

With respect to the immense mansion in the Rue de l'urenne, recently vacated by its inhabitants, who have gone to Auteuil, it has been discovered (says the *Figaro*) that the building belongs to the Paris of the time of Louis XV., and that its original inhabitants were members of the house of Hennequin d'Ecqueville, who held the office of Grand Veneur to the King. It was built by Augustin Louis Hennequin d'Ecqueville, "capitaine général de la vénerie, des toiles, des chasses, tentes, pavillons du Roi, et de l'équipage du sanglier," who in 1741 married Mlle. de Joyeuse.

## NOTES AND COMMENTS.

THE death of ONSLOW FORD, R.A., on Monday will cast a gloom over many studios in London. As he was born in 1852 he had barely reached his fiftieth year, and he appeared to be until very lately as active as a man of thirty. All his friends had anticipated many able works from his chisel. In his style there was a modernity which was more easily perceived than described. Originally he aspired to be a painter, but on the advice of Professor WAGMÜLLER, of Munich, he devoted himself to sculpture. Among his best known works are the statue of Sir ROWLAND HILL, Sir HENRY IRVING as Hamlet, the equestrian figure of Lord STRATHNAIRN, the SHELLEY Memorial and the seated statue of Queen VICTORIA at Manchester, which is the crowning work of his life. His statuettes are charming. One of his sons has already shown ability as a painter.

AN action which was tried last week at Leeds before Mr. Justice GRANTHAM and a special jury related to difficulties which attend the laying out of estates, and which it should be the business of all parties to overcome. Three years ago the Ravenscar Estate Company, Ltd., were engaged in developing their property as a watering-place, for it is near Robin Hood's Bay on the Yorkshire coast. Several of the plots were purchased by Mr. THOMPSON, a builder of Bradford. One of the conditions of sale was that when the plaintiffs had carried a sewer within 40 feet of the plots the purchaser was to pay 3s. per foot of frontage. Mr. THOMPSON declined to pay the charges on the ground of the inefficiency of the sewer, which was inadequate to drain the basements or cellars. The Company brought the action to recover the money. Evidence was given on both sides with regard to the character of the sewer. The defendant's counsel maintained that when the word sewer was mentioned in the conditions it was signified that the sewer would be fitted for its purpose. Mr. Justice GRANTHAM, who heard the case, said it was difficult to determine the rights of the parties with so much contradictory evidence before them. Engineers, according to his lordship, take different views about schemes of drainage. He said it was not to be expected that there should be one scheme for the whole of the estate at once, and all that was necessary was to put in a drain which would be sufficient for the people who purchased the plots. The jury after an hour's consideration were unable to agree except on one point, that there was no undertaking on the part of the vendors to provide sewers for basements. As there seemed to be no possibility of agreement, it was arranged that judgment should be given for plaintiffs on the question of false representation, and it was recorded that the jury were agreed that there was no implied contract on the part of the plaintiffs to lay sewers deep enough for the basement, but they could not agree as to whether the drain was efficient in other respects.

FIFTY years ago there were in the United Kingdom 3,244 places of worship for Congregationalists, with 1,002,567 sittings. According to the last return the number of places is now 4,607, and of sittings 1,641,692. In about two years 257,310l. has been raised for buildings, in addition to large sums to pay off church debts and increase the central fund. Owing to the freedom from precedents possessed by Congregationalists, more originality in planning and designing should be encouraged. The churches should begin to attain a more distinctive character. In poor districts architecture may have to succumb to necessity; but, as money can now be freely obtained, a start should be made in departing from stereotyped plans which were suited for a different sort of service.

THE question of electric lighting in Bognor is to be determined by means of a poll of the inhabitants. The outlay is calculated at 12,000l., and the annual expenditure at 1,750l. It is expected that the revenue will be 2,256l. The discussion on the subject before the District Council suggests that there is still a difference of opinion

in some towns about the superiority of electricity to gas when financially considered. According to the chairman, in Tunbridge Wells by adopting electric light the rates had been reduced 2d. in the £ and in Dover by 3d. The information supplied by Portsmouth, Torquay, Walthamstow and other towns was also in favour of the economy of electricity. But the opposition adduced numerous instances where the electric lighting was not a financial success. Bradford, although possessing electric power, used only 51 electric arc-lamps against 10,000 incandescent lamps. In Hastings it is found more economical to pay the gas company 5,000l. a year for public lighting. Kingston-on-Thames and Coventry have returned to gas, and a specialist called in to advise the local authority at Dalkeith estimated that electric light would cost three times the price of incandescent lamps. There may be cases where local circumstances are unfavourable to the production of electric lighting, but they are few in number. Considering the comparatively short time electricity has been used, the success of the lighting has been remarkable. A similar opposition was raised against gas, and railways were also condemned as being inferior to traction on ordinary roads. Electricity is destined to advance, and in England there is room for it as well as for gas lighting.

## ILLUSTRATIONS.

SEAFORTH CONGREGATIONAL CHURCH.

SELEHURST, SUSSEX.

THIS house, with the entrance lodges, stabling, &c., was erected a few years since for Mr. W. EGERTON HUBBARD upon a very attractive site in the heart of Sussex, a few miles from Horsham. The oak, stone, tiles and bricks were mostly obtained on the estate, and the intention of the architects, Messrs. CLAYTON & BLACK, of North Street, Brighton, was to embody all the better features of the typical old Sussex manor-house.

HOUSE AT WALTON-ON-THE-HILL, SURREY.

THE COURT HOUSE, BROADWAY, WORCESTERSHIRE.

NO. 9 CAVENDISH SQUARE.

NO. 9 CAVENDISH SQUARE is a block of flats at the north-east corner of the square, and is intended to be occupied by people of the upper or upper middle class, as would be likely from the situation. The building has been erected in a first class manner by Mr. T. BOYCE, of 8 Hart Street, Bloomsbury, at a cost of over 40,000l. Both frontages are of red Ibstock bricks (which are hard-faced Leicester brick capable of resisting the weather), and of Portland stone dressings above the ground floor, the ground floor itself being entirely of Portland stone. There is an imposing entrance in the centre of the building as shown in the drawing illustrated this week, which gives a good approach to the interior, and the bay windows going up nearly the full height give the rooms inside a comfortable appearance. Some of the flats are very extensive, one of them on the first floor, for example, containing sixteen rooms in all, besides lobbies and conveniences. There is a separate entrance in Chandos Street to the suite of rooms on the ground floor occupied by a well-known London dentist, consisting of waiting-room and three operating-rooms. At the north end of the Chandos Street side of the building there is a maisonnette with separate entrance. There is a stone staircase going all the way up the building, and in the well-hole is a lift surrounded by wrought ironwork, supplied by Messrs. STARKIE GARDNER. The hot-water work and sanitary work executed by MATTHEW HALL & Co., of Wigmore Street, are of the most complete description, and the decorations throughout are very elaborate.

The architect of the building is Mr. LEWIS SOLOMON, F.R.I.B.A., of 55 New Broad Street, City, and the details have all been carried out from his full-size drawings. Mr. BOYCE's object being to make a first-class building and not merely a paying one.

CHICHESTER CATHEDRAL.—GROUND PLAN.

THE IDENTIFICATION OF WOOD.\*

THE subject upon which I have the honour of addressing you to-night is incomplete, and, as yet, quite in its infancy. As a scientific study it is by no means new, but the technical application of it may be said to be comparatively recent, as might be expected, because a certain amount of progress must be made, and sufficient methodically arranged information must be accumulated before the commercial man can employ it usefully. In short, until science has something substantial to offer, which will stand the commercial test, it is far better to continue the use of the old rule of thumb methods, which, after all, have sufficed to make the world go round till now. Whether the art of discriminating the various species of timber has arrived at that desirable stage I must leave it to your judgment to decide, but I feel that a ventilation of the subject must be productive of good, and hope that it will arouse

sufficient interest to bring recruits to this inquiry. It is a field in which the greater part of the ground is unbroken, and when nearly all other subjects have been thoroughly worked, it is something especially gratifying to an investigator to find himself in the midst of a practically unexplored area. The nearest comparison I can think of would be the case of a man set to classify the specimens of a herbarium, from which all the flowers had been removed. The material would be sufficient for the purpose, the schemes of classification would be at his disposal, but he would be compelled to invent for himself the means of discovering the relationship of his plants one to another. I may say that there is nothing extravagant about this simile, for Radlkofer and the botanists of his school, chiefly Dr. Hans Solereder, have worked out a system by which small and imperfect specimens of plants may be recognised and classified, and in some respects have made discoveries which materially aid us in the discrimination of timber. Unfortunately for us, this school of Radlkofer has confined itself to the examination of such small twigs and woody stems as are usually found along with herbarium speci-

\* A paper read by Mr. Herbert Stone before the Society of Arts on December 4.

mens, and as the secondary wood, or that produced after the first year, frequently differs from the primary wood, which is their special care, their labours are only useful by the way and in rare cases.

The chief contributions to the branch of botany have been made by students of forestry, and as forestry is little known and appreciated in England, it is to Germany that we must look for information. The two Hartigs and Franz Schwartz have dealt with the European trees in a fairly complete manner, and Mayr has made some important contributions to the anatomical characters of the conifers of North America, but foremost stands Nördlinger, who has described the structure of no less than 1,100 species of timber trees, and whose series of sections is the wonder and admiration of the few who have seen them.

J. S. Gamble's "Indian Timbers" is a fine work, and the only one which is published in the English language (saving a translation of a small brochure by Theo. Hartig). His collaborator, Sir Dietrich Brandis, who did the descriptive work for "Indian Timbers," is perhaps the chief living authority on the subject. A magnificent series of 200 sections of American woods, published by Romeyn B. Hough in the United States of America, is another substantial aid, but unfortunately his descriptions accompanying the sections show that the author is unaware of the significance and value of his own specimens.

In all these books there is nothing approaching a scheme of classification. The nearest is contained in the notes accompanying the descriptions in J. S. Gamble's "Indian Timbers," but as they are based exclusively on the local species, they are quite useless when applied to timbers of other countries. All other authors confine themselves to isolated descriptions of species, with an artificial key as a guide amongst chaos.

We can now see what our future labour is, and I must content myself with indicating it, merely repeating that the harvest is ready for anyone who will lend his assistance.

In the meantime there is no necessity to underrate the value of the old time-honoured rule of thumb method, and we shall do well to hold to everything that is good in it, and to add such precise knowledge as can be accumulated. Heretofore everything was left to individual judgment, which implies great experience, needing time and opportunity to acquire. Learners had no easy task before them and no aid, except that of teachers; still it sufficed until foreign timbers began to be imported in increasing variety, which, in proportion, restricted the possession of expert knowledge to the few. The carpenter knows the woods he works with from continually handling them, and can, perhaps, distinguish a dozen or twenty of them with ease. Beyond these he is at sea. The timber merchant dealing in hardwoods has a longer list of familiar woods, and having spent his days amongst them he becomes an authority upon them. But the process of handing a strange piece of wood round until someone is found who knows it, is a part of the daily routine even at the oldest houses. When, as often happens, a species not previously met with turns up, even the most expert are helpless, and I think they will be the first to admit that some means which will eke out their experience is desirable. I have met with cases where a wood well known and largely imported has been pronounced by various timber merchants to be something quite different, and others in which inferior woods have been palmed off upon purchasers when their superficial resemblance to the superior article has been close enough to deceive. I have also known a case where an inferior wood, selling at a low price, has obtained a much higher one by the simple expedient of changing the name to B when it has been previously known as A. Without dwelling on these doubtful practices, which are exceptional, more than to lay stress on the fact that the lack of information makes them possible, I will turn to another class of cases, those in which a consumer desires to match an unknown wood, or having tried a parcel with success, is unable to obtain a second for the reason that he does not know for what to ask.

Many hundreds of consignments of excellent timber reach our shores, and, failing sufficient information as to their name, origin and virtues, are passed by purchasers until they are finally relegated to a rummage sale, where all "unrated" timber is put up to auction for the purpose of recovering the freight and dock dues. Amongst these "unrated" woods have been many which have excited admiration for their beauty or other excellence, and in some cases have changed hands after the discovery of their value at fancy prices. But when the parcel is sold out the trade in these woods is closed, for the unfortunate sender of them is careful not to risk another loss on the same timber; thus no more comes forward, and as the consumer has no means of finding out the name and place of origin of the coveted wood, he has no opportunity of making his wants known to the person who could satisfy them. From what I have seen myself, I feel certain that there are many species of timber trees growing, may be in abundance, in many localities from which shipment might be made that are ignored because they bear a reputation of being unremunerative, and are probably put locally to base uses.

If you will look through any old list of hardwoods you will

see the names of many that were familiar years ago, but which are not now met with. Did the consumption of the timber trade of the last generation exterminate these trees? I cannot believe it, for even if a small locality were entirely stripped of a species, there are few that are confined to such small areas. Possibly, if they grow elsewhere, we may by some good chance hear of our old friends again when other forests are opened up, and I hope that with the increasing means of identification which the anatomical characters afford, we may not only discover the species, but also indicate in what other regions a fresh supply of our lost timbers may be found.

I was recently amused by receiving a circular from a hardwood merchant containing a long list of uncommon woods. I wrote asking for specimens, and was informed that though anxious to oblige the merchant could not send them, as most of the woods enumerated had not been met with for years. The old list had evidently been reprinted from time to time in the hope of supplies turning up.

There are instances already on record where the anatomical characters have been commercially useful, and unknown woods identified by their means have led to inquiries in a proper direction being made for fresh supplies, but this can only be done when the structure is put upon record in such a fashion as to be traceable when needed, a state of things which does not yet exist. The cases in point were the result of a happy recollection of the special structure and not of method. It is also necessary that the scientific name should accompany the description of the structure. If the popular or vernacular names only are known, we really are not much further ahead, because there is usually a name in every locality and sometimes several.

To base this art upon a secure foundation, it is absolutely necessary to obtain authenticated specimens. One may describe the structure of the African oak, and it may be an advantage to identify other specimens of African oak from the description, but it will be useless for a purchaser to inquire for it under that name in localities where it is called African teak. If we only knew the specific name we could point out fresh localities where any botanical explorer may have recorded its occurrence.

By the way, botanical explorers have a vexing way of omitting anything likely to be useful from their descriptions of plants. They describe the flower, leaves and habit with great precision, and I have known, as a rare case, a botanist to mention that a plant produces the fibre, gum, drug or what not of commerce, but he gives no indication whatever of the special features by which the fibre, gum or drug may be recognised. This is lost opportunity, for the information must have been in many cases within reach, and would have been precious, but as it is we must begin again at the beginning, make our own explorations, and in fact conduct a duplicate survey over precisely the same ground, but with a slightly different object. With this view I have appealed to the Colonial Office for authenticated specimens of all colonial timbers, with a view of putting their structure on record and enabling not only our home traders to recognise unfamiliar colonial timbers when they meet with them here, and to satisfy their wants by purchases from our brethren of Greater Britain, to the benefit of each other, but also to enable our colonists to recognise their own woods for their own uses. If experts are scarce in England they must be far rarer in new countries. Besides this, our settlers had a limited knowledge of English trees when they left our shores, consisting of a few names, such as oak, beech, ash, elm, pine, &c., and every tree they met with in their new home became native oak, native beech, &c., with the variation of a few simple adjectives, such as red ash or black ash. When these become exhausted the alternatives are red wood, white wood, yellow wood, iron wood, and the like; hence we must not be astonished to find that in different parts of Australia no less than five distinct species of eucalyptus pass under the name of red gum, and two or more under that of blue gum.

I am fortunate in being able to make my appeal at a time when the office of Colonial Secretary is filled by a man whose foresight and acumen are as keen as his care for the interests of the colonies is enthusiastic. In short, by his kind recommendation of my petition to the various colonial Governments, I have already obtained promises of authenticated specimens of the woods of Canada, the Cape of Good Hope, Victoria, Queensland, Western Australia, Lagos and Rhodesia, and, with one or two exceptions, I have very little doubt that a similar response will be received from those Governments which have not yet replied. In my petition I have asked for a specimen of each wood sufficiently large to provide duplicates for several public institutions.

However complete the knowledge of the colonial timbers may become in the course of the next few years, it will be a mere fraction compared with the work that will remain, and which will be left to travellers who may be persuaded to take note of the timbers as well the flowers they meet with. Perhaps if the scientific side of our study can be developed

efficiently to attract the attention of botanical explorers, we may achieve our end by their assistance.

So far the work of Solereder and others has aroused very little enthusiasm, and it has been stated that the value of the anatomical characters for the purpose of classification is trifling. With this I am inclined to agree in part, because so much stress has been laid upon the sculpture of the walls of the individual cells, failing more prominent characters. It is, no doubt, a valuable contribution to our knowledge to know that certain forms of pits are constant in a natural order; but as usually happens, they are equally constant in a score of the related orders, they afford little help in separating one from another. The primary wood dealt with by the school of Adlkofer is not enough by itself, the material is too sparing and it holds the same position in lignology as animal embryology does to anatomy. It is the study of an immature condition only. Besides this their descriptions are lacking in vividness. As a matter of fact, the diagnosis of the characters of wood depends very greatly upon precision of language, and this again upon a knowledge of the infinite variety of form which may be presented by the pores, rays and soft tissue. It must be clearly understood that the width of the annual rings, the most conspicuous feature, is rarely of any value, and I shall be glad if, when looking at the specimens I am about to show you, you will endeavour to ignore this factor altogether. A ring of oak wood may be  $\frac{1}{8}$ th of an inch wide or may reach  $\frac{3}{8}$ ths, and the difference in the appearance of a piece of wood containing sixteen rings per inch of radius and another only showing two is exceedingly difficult to reconcile. This variation is merely a question of growth, and depends upon the fertility of the soil, &c., so that the extremes may frequently be present in the same piece of wood in the closest proximity. This much may be said, that the annual ring usually makes a good start in the spring, when the tree puts forth its leaves, so that the innermost layer is usually normal; but should the supply of nourishment fail from any cause, such as the destruction of the foliage by frost or caterpillars, the later wood of summer and autumn may be reduced even to disappearing. The full character of the structure is unfortunately only brought out in broad, well-developed rings, and it is by no means rare to find a specimen with which nothing can be done, because no ring is broad enough to show the structure of the autumn wood. Search then always for the broadest ring.

The chief point then to be noticed is the presence or absence of true pores, which may be recognised by their abundance in the inner side of the ring. They are never more abundant in the autumn wood, even when uniformly occupying the whole section. If pores appear in the outer or middle part of the ring while the inner is free from them, be sure that they are resin pores, and that the wood you are dealing with is a conifer, and probably a pine or spruce. The rays are always present, even when microscopic, but they vary greatly in breadth, height, lustre, straightness, &c., each detail having its own particular value. The specimen of oak you have in your hands has extremely broad rays, which are lustrous and of considerable height on a tangential section, but in the transverse section of maple attached to the little cards they are only just visible to the naked eye. Even these are broad comparatively to those of the horse-chestnut and many conifers. As a rule, the narrower the rays in a transverse section the shorter or shallower they are in other sections—that is, the proportion of breadth to depth is remarkably constant.

The year's growth of wood is well indicated in each ring of both oak and maple, but in quite different fashion; the former has bold pore-rings of one or more rows, following on the somewhat poreless autumn wood of the previous year, whereas the latter has a very fine, perfectly distinct line of autumn wood, and the pores, instead of rapidly diminishing outwards almost to vanishing point and assuming a tree-like form, are of uniform size and somewhat sparingly scattered over the small areas formed by the regular cutting of the annual rings by the rays. A close examination of the small oaken block will reveal a number of cloudy bands running concentrically with the annual rings. These are composed of wood parenchyma, or soft tissue, as I shall call it, and are usually present in well-developed rings in all the oaks. The two examples I have selected belong to two distinct types. I choose them as being particularly suitable for the purpose of showing the very different forms the various parts of the wood can assume, but they are only two amongst hundreds of types, for the arrangement of the four elements, the rays, the pores, the annual rings and the soft tissue, is almost infinitely varied.

One of the difficulties of this study is the unending fluctuation of the size in the various parts, which is the outcome of the influence of age, soil and climate, that is to say, of the vigour of growth. The variation which most meets the eye, that of the annual rings, has already been referred to. Next to this the coarseness of the pores chiefly affects the appearance of a wood. This depends more upon age than upon nourishment, and in many

woods, such as the oak, the average size of the pores augments from year to year till the tree reaches its prime, and then becomes more or less constant. Other woods show their variation in a much less degree. This makes accurate measurement difficult; in fact, a statement that the average diameter of the pores of the oak is a certain fraction of a millimetre is really useless as a guide; therefore Nördlinger, and after him Brandis and Gamble, adopted the method of using a series of well-known woods and employing them as standards with which to compare others; each type thus shows its own limits and the measuring process becomes an estimate of the range of fluctuation in size. This is a simpler process than it seems, and in practice all that is necessary is to have a set of thin sections or shavings between two pieces of thin glass, which may be laid upon the section or even the solid wood of another specimen, and the size of the pores, &c., as ascertained by direct comparison. In all cases where the structure of a wood has to be described in words, the largest pores or rays in each ring are only regarded, and the size is expressed by figures which indicate the minimum and maximum size of these largest elements only, as found in rings of varying age. The reason of this is obvious. The pores are found to diminish in every ring, sometimes only a little, as in the maple, but more frequently to vanishing point, as in the oak.

There is considerable harmony in the variation of the characters of wood, both physical and anatomical. The weight per cubic foot, the hardness, the state of saturation, amount of ash, the elasticity, &c., vary regularly, according to age and distance from the root of the tree. Weight is found to increase from the foot to the first branches, and then to decrease from that point upwards. The size of the rays, cells and vessels, as already stated, increases with age, so that in the eightieth yearly ring of an oak, counting from the pith outwards, these parts will be much larger than in the first. It must be borne in mind that the eightieth ring was produced seventy-nine years later than the first, so that we must be careful not to confound the age of the tree with the age of its wood.

Similarly, inasmuch as the sapling oak of one year is but a fractional part of the weight of the mature tree, and as the growth in height has been caused by the superposition of additional coats of wood one upon another, like so many cones, it follows that the wood of the upper parts must be younger, and therefore the innermost ring of this upper wood must not be assumed to be old because of its position. It is natural to assume this, and many would count the rings on a piece of wood from the upper part of a trunk, and pronounce it to be of such and such an age, whereas that may not be within fifty years of the truth.

Many tropical woods show scarcely any perceptible division between the growth of one year and the next. Their growth seems free from any check, though it may vary in vigour. Hence the familiar ring-boundaries become vague or entirely lost; even the rise and fall in the size of the pores is frequently absent, and they seem to increase uninterruptedly from the pith outwards to the bark. This state of things is found in quite a number of unrelated tropical South American woods, though it is by no means confined to them. I have often wondered if any of our European evergreen trees, such as the holm oak (*Quercus ilex*), if acclimatised in a tropical region, would lose their characteristic rings, and take upon themselves this uniform structure of wood. No doubt the climate would modify it somewhat, and it has been urged that this circumstance vitiates the value of the anatomical characters for purposes of classification. True, as regards the succession and dimensions of each zone or its component parts, but their structure and arrangement remain the same, and will always stand good.

In many natural orders the soft tissue which is so prominent in concentric circles in the oak affords us great assistance. It appears in a multitude of forms, and may be found in little narrow circles or borders round the pores, which show on a vertical section as cloudy margins to them. It may expand from these circles laterally into wings forming a spindle-shaped patch, in the midst of which the pore may be embedded. These wings may widen until they meet others, and join up to form circles concentric with the rings, straggling oblique lines, or long undulating wreaths. The lines may become narrowed to microscopical fineness, making a mere network with the rays, or may be broad conspicuous bands. In fact, from mere ill-defined scraps the soft tissue can vary to elaborate tracery. It is somehow or other closely connected with the natural affinity or relationship of woods, and more often than any other character helps us to guess at the place of a species in the natural system, but (there is invariably a "but" in connection with these details) it is not rarely absent in a genus or species, where one would most expect it. Gamble relies upon this feature in his artificial classification of the Leguminosæ, and it works beautifully within the limits of the Indian species, but it fails entirely where a larger range of leguminous plants is taken, especially in respect to those of temperate climates. He relies especially

upon the width of the bands of soft tissue, but in applying it I have so often met with intermediate gradations of breadth, that I am forced to conclude that its use in this order must be restricted to small groups of species only. The extremely fine bars which may be seen crossing the rays in the ebonies, and the somewhat different bars characteristic of the lancewoods and many others, hold good over large numbers of species, so that it becomes a matter for investigation to find out in which particular form it may or may not be relied upon.

The vertical sections, *i.e.* the radial and tangential sections, will often elucidate obscurities of structure, and give one a very clear idea of the structure of wood as a whole. I think one obtains a more securely based conception of what wood is by commencing to study it in the solid instead of by macerations, or even thin sections. To study the cells first under high powers is, to my mind, beginning at the wrong end. The microscopic part of the work is one of the higher walks of the science, and is better led up to by way of the study of the wood *en bloc*. I have met but few botanists who have anything but a vague idea of what wood in general is when viewed under the microscope as an opaque object. Beautiful as the wonders revealed by the microscope notoriously are, I scarcely think anything more gorgeous can be found than that which some of our woods will afford. The preparation is so simple—a plane with a keen iron, or even a sharp pocket-knife, is all that is required, and a smooth and clean-cut surface will not only show you an unexpected play of colour, but will demonstrate the relation of cell to vessel and vessel to ray in a manner impossible in a thin section in which one endeavours to separate the desired layer from all the deeper-seated tissue. Wood is much more transparent than one would think, and the subjacent cells appear distinctly below those immediately on the surface, therefore the relations of each cell in every direction become evident. These show every variation of amber, ruby, gold, rich browns and black and bright translucent beads of resin, which flash in the light like jewels that tempt one to forget one's work for the indulgence of the eye.

With all the additional aid which the anatomical characters give, we are not a great deal further advanced until we have some system of arriving step by step at the wood we desire to identify. It would be rash to enter upon the controversy concerning the systematic value of these characters, and to attempt to bring them into harmony with orders and genera. The time for this is not yet, but for technical purposes the natural system need only be respected as far as it is useful. Therefore an artificial system will serve our turn.

The key provided by Nördlinger makes a mere commencement, and after guiding us a little way leaves us stranded in the midst of a large group of species which have to be dealt with one by one. The key to the European woods constructed by Hartig and the similar one by F. Schwartz are complete and fairly satisfactory, but are so very limited. I have used all three, and can candidly say that they are much better than nothing, but require considerable study and much practice to use. For my own use I have constructed a key on a similar principle, but use different characters for the preliminary stages. As it seems to me, amongst the woods of the broad-leaved trees the rays are the most constant character. I base my divisions upon them, first separating those woods having two kinds of rays, as many cupuliferæ, from those which have but one. I then divide the latter into those whose rays are separated by intervals greater or less than the transverse diameter of their larger pores—that is to say, the intervals between some may be equal to the pore diameter at the most, and conversely in the other class the intervals may be equal to the pore diameter, but never less. Further subdivisions, which it would be tedious to detail, are based upon the presence of soft tissue and its arrangement, followed by the arrangement of the pores, concluding with the degree of definiteness of the ring boundary. This most elusive character is one of Nördlinger's preliminary divisions, hence the difficulty of using his scheme.

The principle I have tried to follow is to start from plain or fairly obvious characters about which there can be little doubt, and to leave the more dubious ones for the end of the series, where there are fewer species to deal with and other aids come in. By this system members of the same genus having a similar arrangement of rays, pores and soft tissue, fall into the same ultimate group, which they do not when the ring-boundary is relied upon (*vide Platanus acerifolia* and *occidentalis*). When these ultimate groups are reached, physical and chemical characters may be employed in discrimination. The range of the weight per cubic foot, hardness, colour of the solution produced by boiling in water and alcohol, reaction with iron salts, capacity for absorption of water, phenomena produced during burning, character of the surface, whether dull or lustrous, and the particular elements, rays, pores or ground tissue which produce the effect, and lastly the colour.

In every description of wood, by a practical man, the elements of weight, hardness and colour come in. Sometimes

the weight per cubic foot is given, and the colour apart from its fluctuations is often accurately pictured, but the hardness is a quality which is practically left to our imagination. I have been so much impressed with the necessity of some means of measuring the degree of hardness, that I have constructed an instrument which is capable of giving a fairly accurate reading of the resistance to impact of a wood (not of its hardness pure and simple, because the resistance to impact is made up of elasticity, plus hardness), but it is a fair parallel to the impression of that which we call the hardness makes upon our sense of touch. I will not weary you with a description of this contrivance, but will merely mention that the principle is as follows:—A steel ball of a known weight falling a definite distance upon a surface at an angle of half a right angle will fly off in a horizontal direction, and describe a curve or trajectory which will be longer or shorter according to the amount of force absorbed by the wood. A self-recording arrangement and all necessary adjustments are attached to the machine. The hard and soft zones of a wood give different readings, so that a number of trials have to be made and an average struck. I take the average of ten trials, displacing the wood five millimetres between each.

The solution obtained from boiling a small quantity of shavings is of a valuable and interesting character, full of surprises, and affording many lovely colours. The reaction with iron salts is useful in cases where the change of colour is displayed in different degrees by different kinds of tissue. The burning of wood often causes various coloured resins to exude, and affords evidence by means of the aroma or by the ash. A familiar example is the smell of the well-known Chinese joss sticks, made from the sawdust of sandal wood, and the two Australian paving woods, jarrah and karri, may be known by their producing a black cinder and a white ash respectively.

## INSURANCE VALUE OF GLASGOW EXHIBITION.

A SPECIAL correspondent of the *Glasgow Herald* writes:—It is safe to assume that but a small proportion of the many thousands who thronged the beautiful art galleries in the late Glasgow exhibition fully realised the immense sum of money which was represented by the magnificent and unique collection of art and historical exhibits so carefully and artistically placed there for their inspection, and before the memory of that great display fades entirely away a few particulars of that value may even now prove interesting. For various reasons it would not have been judicious to publish actual figures during the time when the exhibition was open, but now that the collection is practically dispersed most of these objections are disposed of.

Many will be astonished to learn that the actual insurance effected with the insurance companies was almost enough to build six art galleries similar to the palatial one of which all Glasgow is so proud, the actual figures of such insurance being 1,326,997*l.* and this figure, immense as it is, does not by any means represent the actual value, because hundreds of exhibits through the apathy of their owners were not insured. Again, no money could really represent the true value of many other exhibits, such as the relics relating to Mary Queen of Scots, to Prince Charlie, to the times of the Covenanters, to Robert Burns, Walter Scott, David Livingstone, and a host of others, relics which could never be replaced if destroyed in any way.

In round figures there were 10,000 separate exhibits, divided among 1,550 lenders, to whom the public are under a great debt of gratitude; and when it is understood that these exhibits were not insured *en bloc*, as is generally understood, but that each insured article had a separate value attached to it, varying from 11*s.* 6*d.* to 14,000*l.*, in the books of the art galleries, some idea may be gathered of the great mass of details, in this department alone, which Mr. Paton, the able superintendent, and his assistants had to grapple with.

Everyone must remember the beauty of most of the sculpture in the great central court and throughout the corridors and balconies. The value attached to this sculpture was 24,909*l.*, the lowest value being 5*l.*, and the highest being two sums of 1,000*l.* on two statues which were greatly and justly admired. Entering the galleries by the south door and turning to the right, one found oneself in the least visited courts, those devoted to the "art object" section. This wing comprised five galleries—one devoted to photography, one to "black and white," and three to the art objects. Dismissing the photographs, excellent as they were, for they were only nominally insured, the value of the 400 exhibits in the "black and white" gallery was 13,426*l.*, the highest values being attached to a drawing by J. F. Millet, 600*l.*, and 4,000*l.* to eight old engravings on one of the window screens.

The chief interest financially, however, was attached to the long east gallery, known as No. III. gallery, where were gathered the bulk of the "art objects;" the total insurance of

contents of this room was 93,356*l*. The indifference displayed to the treasures here gathered together is well illustrated by the remark made by one man to his companion, "Come on, Jock, there's no much to see here." A fact—only his language was somewhat more emphatic.

A very few details regarding this room will suffice to impress on the mind the value of this unappreciated department. A room containing jewels, a casket and a silver ship (or nef) was valued at 21,480*l*; a flat case containing carved ivories, 21*l*; a case of gold and other boxes, 4,933*l*; a case containing majolica, lapis lazuli, &c., 13,775*l*; and the beautiful unique musical instruments, 3,000*l*. Then a little dark-wooded Limoges salt-cellar at 600*l*, a sardonix bowl at 5,000*l*, and an ivory triptych 3,000*l*, illustrate the values attached to such articles by their owners. No space can be allocated to describe the wonderful Rhodian and majolica wares (50*l*. for a single plate), old tapestries, Roman and German glass, wood-carvings and so on. In the court of this section the architectural drawings were valued at 3,265*l*, but a large proportion of these were not insured.

The five galleries on the west side of the central court were devoted to Scottish historical exhibits and those relating to Scottish sport, and it is safe to predict that no such collection will be gathered together for very many years. There were over 3,000 exhibits here, and the value attached was no less than 265,896*l*; but as this section comprised the relics before mentioned, even this huge sum fails to represent the value of this section. A very few details may prove of interest. The Livingstone relics were valued at 500*l*; a portrait of Claverhouse, 5,000*l*; one of Mary Queen of Scots' dresses, 200*l*; a collection of miniatures, chiefly of the Stuart family, 3,000*l*; a portrait of Charles I. by Vandyke, 7,000*l*; and Burns's manuscripts, 4,000*l*. Want of space forbids mention of the values attaching to priceless charters from William the Lion, Bruce and Queen Mary, to prehistoric relics, to guns, swords, maps, instruments of torture, &c.

Turning now to the consideration of the most popular of the sections in the galleries, namely, that devoted to the oil and water-colour pictures, the insurance upon this wonderful collection amounted to the very large sum of 896,068*l*, and if the value of the pictures in the historical section be added to this, the total of 1,000,000*l*. may be taken as the insurance value of the pictures, a sum large enough to take one's breath away, and to make the citizens of Glasgow proud of the energy of the art committee, which was able to gather together such a valuable collection of artistic gems for their education and recreation, and for that of the countless visitors to their palatial galleries.

The two royal reception-rooms were devoted entirely to the old masters, and here only were such pictures to be found. The east room possessed fourteen pictures, the insurance upon which amounted to 47,800*l*. The principal items in this sum were 10,000*l*. on a magnificent example of Rembrandt, 5,500*l*. on another picture by the same artist, 6,000*l*. on a portrait by Franz Hals, and 5,000*l*. on a fine example of Vandyke's masterly portraits. The west room contained eleven pictures, by Lorenzo, Botticelli, Perugino, &c., and the insurance was of moderate sum of 25,700*l*., the largest amount being 5,000*l*., attached to one of Botticelli's works.

Proceeding upstairs, the visitor found five galleries in each wing, all devoted to the modern school of artists, although three galleries, Nos. XI., XII. and XIII., were devoted to works by deceased British artists. Here were to be found examples by Turner, Constable, Linnell, Raeburn, Millais, Burne-Jones, Cox, Romney, Leighton, Wilkie and a host of others whose names are household words. The values attached to these galleries were as follows:—140,275*l*. on No. XI., 1,306*l*. on No. XII., and 75,855*l*. on No. XIII. Passing into the galleries devoted to works by living artists, a brief description of these may not be out of place.

The small gallery No. XIV. contained excellent works by Watts, Whistler, McWhirter, Wyke Bayliss, Waterloo, Windus, &c., and was insured for 24,694*l*; and the last room in this wing—No. XV.—was insured for 47,113*l*. Here were to be found fine examples by Alma-Tadema, Roche, Farquharson, Cameron, Noel Paton, Peter Graham, Orchardson, Henry, Guthrie, A. K. Brown, Sir George Reid and others, and this was one of the most popular galleries.

Strolling round the east corridor, the contents of which were insured for 22,285*l*., several interesting and valuable pictures were to be found—"Orchardson's "Testing the Blade," P. W. Orr's "A Bill from the Mantua Maker," Landseer's "A Fallen Monarch," Docharty's "Loch Etive," and others equally so; but the public did not sufficiently appreciate the corridors, considering that the works placed there were what might be termed the "rejected ones." This, however, was not so.

Crossing to the west wing, one found oneself first in the most frequented of the galleries, viz. No. XVI., a large room where were placed many large and popular paintings. Here were Abbey's "Trial of Queen Katherine," Macbeth's "A

Somersetshire Cider Mill," Dicksee's "Passing of Arthur," Murray's "A Fair Land is England" (purchased by the National Gallery of New South Wales), Farquharson's "A Weary Waste of Snow," Herkomer's "The Old Guards' Cheer," Fildis's "Village Wedding," a very popular picture; Gow's photographic "Diamond Jubilee," Poynter's "A Greek Dance," Colin Hunter's "London from the Tower Bridge," Lady Butler's "Scotland for Ever" (belonging to Leeds Corporation—why not to Edinburgh or Glasgow?), and many others. The insurance upon this room, containing ninety-five pictures, was only 61,400*l*. In the small gallery No. XVII. were to be found the first examples of water-colours by British artists. The insurance here was only the trifle of 10,004*l*; but R. W. Allan, Erskine Nicol, Coventry, Austen Brown, William Young, Millie Dow and others were efficiently represented.

In a newspaper article it would be utterly impossible even to mention a tithe of the lovely water-colours found in Gallery XVIII. That gallery was crowded with gems from dead and living masters—masters whose names will be household words when the many thousands who admired their works will have passed away—Turner, Bonington, Pinwell, Varley, Girtin, Muller, Hunt, Copley Fielding, Ruskin, Holland and so on through a list of distinguished names. The insurance here, although fairly large, 75,685*l*., was certainly inadequate—for instance, twenty-three examples of Turner for 22,620*l*., barely 1,000*l*. each, and only 10*l*. and 50*l*. on examples of Varley and Girtin.

The small alcove devoted to miniatures containing 110 gems of the miniature painter's art was insured for 2,079*l*. 10*s*. (included in the total of Gallery XVIII.), and here Praga, Gertrude, Massey, Collier, Comrie Smith, Miss Cotton, Haig, and others were well represented.

Gallery XIX. introduced us first to the great school of foreign artists, foreign to us in their nationality, but far from foreign to us in their art; no true art is foreign to any nationality, for such art portraying only the beautiful in nature represents that which is common to all countries, and is foreign therefore to none. The characteristics of this room were restfulness and quiet beauty, and the 25,411*l*. of insurance was no gauge of its artistic value.

When entering the last gallery, No. XX., not a fraction of the visitors realised the immense financial value of the treasures therein displayed, for the general tone of the room was of a subdued nature, and brilliance of colour (so beloved by the general public) was conspicuous by its absence; but when they are informed that no less than 253,355*l*. was the insurance value, they may realise too late the nature of the work in which so many displayed little interest. Three small pictures together in a corner of the gallery, each 9 inches by 4½ inches, 8,000*l*. is but one instance of the enormous values which might be cited, but all true admirers of nature could not but be impressed with the beauties of the three Maris, of Corot, Meissonier, Millet, Isabey, Israels, Jacques, Troyen, Bosboom and the rest, and none are likely to forget "The Bridge," "A Souvenir of Dordrecht," "Le Lac" or "The Six Windmills," four pictures alone worth coming many miles to see.

The West Corridor contained a beautiful example by Diaz, "Diane Chasseresse," De Neuville's "Defence of Rorke's Drift," Brett's "Echoes of a Distant Storm," Rosa Bonheur's "Easy Times," Peter Graham's "Crossing the Stream"—these pictures, and the insurance value of 34,185*l*., will for ever dispel the idea that the corridors were the homes of the rejected.

In the balconies round the Centre Hall were many cases filled with splendid old silver, old Derby china, Japanese ware, ivory carvings and sewed pictures; while upon the walls of the staircase were old tapestries (valued from 1,000*l*. to 1,500*l*. each), the total insurance of which was about 30,000*l*.

Much more might be written regarding what was a veritable treasure house, but the idea prompting this article, to give a general idea of the financial value apart from the artistic value, will have been finally attained by the following summary of the insurances effected:—

|                                                                             |            |
|-----------------------------------------------------------------------------|------------|
| Oil and water-colour paintings (apart from those in the Historical Section) | £896,068   |
| Sculpture                                                                   | 24,909     |
| Architecture                                                                | 3,265      |
| "Black and White"                                                           | 13,426     |
| Photographs                                                                 | —          |
| "Art Objects"                                                               | 123,433    |
| Historical Objects and Pictures                                             | 265,896    |
| Total                                                                       | £1,326,997 |

The Tender submitted by Mr. John Ashby, Lowestoft, has been accepted for the Congregational church, South Cliff, Lowestoft, and building operations have been commenced. The contract amounts to 1,698*l*. (architects' estimate amounted to 2,000*l*). The architects are Messrs. George Baines & R. Palmer Baines, 5 Clement's Inn, Strand, W.C.

## ARCHÆOLOGY IN SCOTLAND.

**H**ALF a century having elapsed since the "Proceedings" began to be issued at the opening meeting of the Society of Antiquaries of Scotland, an address was delivered by Sir Arthur Mitchell, K.C.B., at the request of the Council, on "The Pre-history of the Scottish Area: a Review of the Work of the Society for the last Fifty Years."

The first part of the address took the form of a brief description of the special features of nine different classes of prehistoric objects that were peculiar to Scotland, the collections of such of these as were portable being exhibited from the museum, along with enlarged sketches of the others.

The first class was a collection of a remarkable series of stone balls, knobbed or decorated on the projecting discs, the use of which was unknown. There were 135 in the museum, and many others were known, but the most remarkable thing about them was that all the specimens known to exist had been found in Scotland, except one, which is now in Ireland, and they have not been found in any other country of Europe, or any other part of the world, but they have been found in all parts of Scotland. Before 1851 there was only one specimen in the museum; since that time 134 have been added to it.

The next class of objects of antiquity referred to was the brochs, those great dry-built round towers of which Mousa, in Shetland, is the best preserved and best-known example. They range from Shetland to Berwickshire, forming a salient feature in the prehistoric aspect of the country, all the more remarkable that they are peculiar to Scotland, not a single example ever having been found elsewhere. Before 1851 we knew little or nothing about the broch structure; now there is no Scottish class of antiquities that has been more thoroughly investigated and described by members of the Society, the extensive list of papers in the Proceedings beginning in the first volume with one by Mr. A. H. Rhind, the founder of the Rhind Lectureship, on his excavation of a broch at Wick in 1857, and ending fitly with the account of the valuable and extensive investigations of Sir Francis Barry by Dr. Joseph Anderson in the volume for the current year.

The third class of objects to be dealt with was a series of massive armlets of bronze, of a form which is typically Celtic, with peculiar but highly effective decoration, enriched by the use of enamels. Of these thirteen specimens are known, and all but one have been found in Scotland. The exception is again one found in Ireland. None have been found in any other country. None of these objects are in the museum, and all but two have been acquired within the last half-century. Referring next to the remarkable and still unexplained symbols of the sculptured stones, he pointed out that, while they occur more than two hundred times in Scotland, not a single example has been found out of the country, while within it their area is chiefly confined to the east coast north of the Forth. A series of silver chains with massive terminal links, which in some cases bear the symbols incised upon them, was described, and of which there are five examples in the museum, all but one having been obtained since 1851. He thought the number sufficient to constitute a class of objects of antiquity which as yet belongs exclusively to Scotland. There was next a class of large oval knives of a hornblende stone, of which there was no example in the museum before 1859, since which time thirty-two specimens have been obtained, more than sufficient to show that they constitute a distinct class of relics. They have not been found out of Scotland, and within it they have only been found in one locality, Shetland, and there they have been found in apparent association with polished stone axes. Another class of stone implements which are as yet confined to a special locality are the circular discs from Culbin Sands, the precise use of which is unknown; but they form a very distinct class, and there are now seventy-two specimens in the museum. They have not been found out of Scotland or anywhere in it but in Culbin Sands.

The eighth class of relics he desired to notice was largely represented in the museum. They were extremely rude implements of five or six different varieties of form, but all made of a schistose stone by chipping, a few only having their point ends rubbed smooth. They were first found in Shetland by Dr. Hunt and himself in 1865, and since then they had been found also in Orkney and in St. Kilda; but they had not been recorded as occurring anywhere out of Scotland. Fifty years ago their existence was unknown, and now they are represented in the museum by over 250 specimens. They are so rude that many visitors look on them as palæolithic, taking their rudely chipped character to be sufficient evidence, which, of course, is an error. But their age and use or purpose have still to be determined. The last class of objects of antiquity to which he called attention were the horned cairns, great sepulchral piles of stones reaching as much as 240 feet in length, with one or more burial chambers. They are not structureless, but possess a definite external form, terminating at both ends in curvilinear projections like horns. There may be an alliance between them and the long barrows of England,

but they have distinctive characters. As yet they are confined to the county of Caithness, but they may be found in other parts of the country. Fifty years ago their existence was unknown. They are probably the oldest, or among the oldest, structural antiquities in Scotland, and they belong to Scotland only. No palæolithic remains have been found in Scotland.

The distinctiveness of the pre-history of an area may consist in the absence as well as in the presence of certain classes of relics. Other classes of objects teaching the same lessons as to the pre-history of Scotland might have been adduced, but these would suffice to make the teaching plain and to disclose the lesson that Scotland had a pre-history as well as a history of its own. Still more had they shown that the pre-history of some parts of the Scottish area differed from that of other parts. As it is with its history, so it is with the pre-history, both as regards the whole area and as regards its parts. Then, further, the facts which had been stated and the classes of relics exhibited disclosed much archæological work done by the Society during the last half-century, and made it clear that it was the work accomplished during that period which had given him the ability to speak as he had done about the proved existence of a special pre-history of the Scottish area. He had made prominent what he regarded as the true field of the Society's work—the pre-history of their own country, of which it had been the great aim of the Society during the past fifty years to discover as much as possible. He scarcely thought he would be putting it too strongly if he said that with other areas this Society had but little concern; but if this were thought too strong, he should certainly be safe in saying that everything relating to the pre-history of other areas was of secondary importance and had scarcely any other value in the studies and researches of this Society than that through comparison all histories are histories of different areas, and the pre-histories of these areas must in like manner be worked out separately. We know now that we possess a distinct pre-history. Fifty years ago that could not have been said. The Society has therefore worked with success, and that success has been largely due to a concentration of effort on this particular line. But it had also been due to the way in which the work had been done, with as much strictness in its methods and as much doubting as are demanded in other departments of science.

After a brief review of the history and work of the Society during the seventy years of its existence before 1851, Sir A. Mitchell described more fully the amount and character of the work done by the Society since that date, taking it in its different departments. Referring to the growth of the museum and library, he remarked, first of all, that the Society, in working for the enlargement of the museum, was working for the nation, and not gathering material for its own exclusive use. It is not the Museum of the Society of Antiquaries, but the National Museum of Antiquities of Scotland. The Society, however, has an intimate connection with it in being entrusted by the State with its care, and it is now housed in a splendid building given to the country by a former secretary and vice-president—the late Mr. John Ritchie Findlay. And the Society's interest in its growth has been well shown.

During the fifty years the collection has grown from 1,560 catalogued objects to 70,654. This increase has been chiefly in those classes of objects which illustrate the unwritten history and the pre-history of Scotland. Of sepulchral pottery there were eighteen urns in the museum in 1851, now the unique collection of Scottish sepulchral pottery numbers 358, and other classes have shown a similar and in some cases even a greater increase. The growth of the collection of Scottish coins has also been large, numbering now over 2,200 specimens. The library, which is national, like the museum, contains over 10,800 volumes. Both the library and the museum are national in the sense that they are the property of the nation. This makes their preservation secure. But they are also national in the sense that they are largely collections of objects and of books illustrative of the nation's history and of the pre-history of the national area. And Scotland's history and Scotland's antiquities belong to us as they belong to no other people, for no other nation can divide with us the peculiar interest we have in them. Referring next to the Society's publications, the number of papers printed in the four volumes which represent the work of the Society for the seventy years before 1851 is 231, and the number of illustrations 192. The number of papers printed since 1851 is 1,568, contributed by 477 persons, and the illustrations number 7,240. The number of the Fellows has risen from 230 in 1851 to 712 as at the present date. The growth had gone on steadily, and this was the desirable evidence of popularity of the right sort, which could be attributed to nothing but a growing recognition of the good work done by the Society, and of the successful management of its affairs.

An outstanding feature of its work during the last half century had been the earnest effort to introduce those methods into its inquiries and researches which are required in other branches of scientific work. And such an effort was and will

needed, because in archæological studies the temptations to sensationalism, baseless assumptions, credulity, ungrounded, in and superficial speculations, and half-done work are so strong and so numerous. In no field of research should the habit of legitimate scientific doubting more prevail. This doubting is not of the kind which makes the worker miss something of possible value and within sight by causing an unwillingness to go on and investigate further, but does the reverse of this, and the greatest doubter is often the most earnest worker. In all branches of scientific work there occurs another danger from the confusing of opinions with facts, but none does this occur so frequently and with such damaging results as in archæology. Conclusions are not facts; they are opinions, and science requires a rigid separation. It was a necessary result of work so done in finding out, recording and preserving everything that could in any way disclose the unwritten history and the pre-history of the Scottish area, that the value attached to curios and such things as derived their interest mainly from being said to have belonged to some famous or infamous person in history, should be lowered, and that a higher scientific value should be given to objects which, though rude, commonplace, or coarse in finish, supplied material for the scientific study of a period historic or pre-historic. There had also arisen a greater caution in regarding findings found in seeming association as necessarily contemporaneous, and in hesitating to conclude because some object has not been found, or something is not known to have occurred, that the object does not exist, or that the thing will never occur. There was also, he thought, an increasing hesitation in seeing evolution from low to high when nothing of the nature of such an evolution had really presented itself. It was not easy to explain why there seemed to be a pleasure in believing that something illustrating this kind of evolution had been discovered. The signs of a progressive degeneration or debasement did not appear to be so captivating, and yet, from scientific point of view, they might be quite as important and interesting.

Work done in the spirit he had indicated seemed to lead to the making of exhaustive investigations of definite portions of the field of archæology, such as that of the late Dr. John Alexander Smith on the animals that have become extinct in the Scottish area; of Dr. D. Christison on the native forts of Scotland; of Dr. Munro on the Scottish crannogs; of Dr. Joseph Anderson on the brochs and horned cairns of Caithness; of Mr. Brook on the Scottish Regalia and Maces; and of Mr. Richardson on the Scottish coins in the museum. Perhaps the real pioneer in this sort of work was the late Dr. John Stuart with the Sculptured Stones of Scotland. Closely akin to this kind of work were the steady pursuit of a fuller knowledge of the Roman occupation of Scotland by excavations at the charge of the Society, aided by donations from Sir Herbert Maxwell and the Hon. John Abercromby, and the examination and planning to scale of the stone circles of Scotland by Mr. F. R. Coles under the Gunning Fellowship. It came naturally that work of the high character and with the definite aims which for the last half-century the Society had encouraged should entail the disappearance of dinners, excursions, conversaciones and other festivities of the period before 1851. With its present large membership well distributed over the country, the interest in the Society ought to depend on the amount and quality of the work it does, and nothing so certainly gives strength and popularity as a well-founded reputation for earnest, hard, good successful work. Men and women desire to belong to a society with that reputation, and regard it as an honour to help on a work which is yielding valuable additions to knowledge, and which, relating closely to their own country, is gratifying to their patriotism.

Referring next to the cost of the work done during the last fifty years under the head of the Society's work proper, including the amount spent on research by way of excavation or otherwise, and on the publication and illustration of the results of research, as well as on the increase of the collections of antiquities and books, and also the amount spent by the State on the maintenance and extension of the museum and library since 1859, when they became the property of the nation, he showed that this large expenditure was of itself a sign of the great increase in the amount and quality of the work done by the Society and of the increased importance and utility of the institution in which the scientific results of this work were preserved, and are to be preserved in all time coming for the use of the public. In conclusion, he referred to the Rhind lectureship, founded in 1874 by the late Mr. Alexander Henry Rhind, a Fellow of the Society, which had since that time supplied twenty-five courses of lectures free to the public and fourteen volumes published at the charge of their authors, while it had in various other ways influenced the progress and prosperity of the Society, especially in deepening and widening the interest of Scotland in the Society's work and aims.

The president, Sir Herbert Maxwell, M.P., in moving a vote of thanks to Sir Arthur Mitchell for his address, referred

to his long connection with the Society of over forty years, his numerous contributions to its proceedings, all distinguished by his characteristic acuteness of scientific observation and originality of treatment, and the many and valuable services he had rendered in the offices of councillor, secretary, Rhind lecturer, and vice-president.

## THE INDIAN MEMORIAL TO QUEEN VICTORIA.

AT a meeting of the executive committee of the North-Western Provinces Victoria Memorial Fund, held at Allahabad last month, it was resolved that, subject to approval of the designs they may submit, the local committees of Muttra, Gorakhpur, Budaon and Etawah, in view of the large sums they have collected should be allowed to erect their own memorials to the late Queen-Empress, similar permission having been accorded at a previous meeting to the committees at Cawnpur, Bulandshahr, Moradabad and Farakabad. For each of the provincial memorials at Allahabad, Agra and Benares the sum of a lac of rupees (6,666*l.* 13*s.* 4*d.*) was allotted, 2,000*l.* of the amount in each case being earmarked for a life-size bronze statue, and the remainder for the canopy, plinth and pedestal, which are to be in the Hindu style of architecture at Allahabad and Benares and in the Indo-Mohammedan style at Agra. It was resolved to offer premiums of 200*l.* and 100*l.* for the two best designs in each of these styles of architecture reaching the hon. secretary by June 1 next. While competitors are at liberty to select their own material for the canopy, it was suggested that for the Hindu style the most suitable stone is that procurable from the Sherajpur quarries, in the Allahabad district, and that cream-coloured sandstone or white marble is the most suitable material for the Agra memorial.

## THE STEVENSON MEMORIAL.

A CIRCULAR letter has been sent by Mr. J. H. Napier, the secretary and treasurer of the Robert Louis Stevenson Memorial Fund, to the general committee in explanation of the delay which has occurred in the completion of the memorial. After detailing the steps taken for the collection of funds, he says that in May 1898 the executive were in a position to estimate the sum likely to be available for the purposes of the memorial, and as this was not of a sufficient amount to warrant any attempt to erect an open-air memorial, it was finally agreed to seek permission from the board of St. Giles High Kirk, Edinburgh, for the erection of a mural monument within its walls. It was further agreed to entrust the work to Mr. Augustus Saint Gaudens, "the only sculptor of note who had studied Mr. Stevenson from the life." Mr. Saint Gaudens accepted the commission, and after negotiations with the St. Giles Board had been brought to a satisfactory issue, visited Edinburgh in January 1899 for the purpose of studying the proposed site for the memorial. In May 1899 his design was submitted to the executive and to the St. Giles Board, and was approved. In December 1899 Mr. Saint Gaudens submitted a revised design, which was at once approved by the executive, and remitted to the St. Giles Board, who intimated approval in March 1900. By that time, however, Mr. Saint Gaudens had decided to revert to his original design, and two months were occupied in correspondence with the Board in regard to this change of plan, and also as to the terms of the epitaph to appear on the memorial. All details having been satisfactorily adjusted, Mr. Saint Gaudens completed his model for the memorial, and was just about to have it cast in bronze, when, in July 1900, he became dangerously ill, and had to leave Paris for the United States, where he has since undergone several serious surgical operations. In the earlier months of the present year, however, letters from the sculptor indicated that the materials for the erection of the monument might be expected very shortly, but in June he wrote to say that he was so anxious that the patine should be to his satisfaction that he had ordered the bronze cast to be forwarded to him in America for inspection. He wrote on November 24 that the patine did not satisfy him, and also that the completed bas-relief suggested to him the desirability of modifications which would improve its appearance. For these reasons, he intimated, he was remodelling the design, and intended to have a fresh cast made. This alteration involves a delay which, in his opinion, should now only postpone the completion of the memorial until the coming spring.

The Edinburgh School Board have received sixteen applications for the vacant post of architect to the Board.

## LONDON IMPROVEMENTS.

THE President of the Society of Architects, Mr. Silvanus Trevail, at the usual monthly meeting of that body at St. James's Hall, Piccadilly, before the ordinary business commenced, said he desired to thank the Press for the kind attention it had given to his inaugural address, especially to those portions of it which referred to the proper qualification and statutory registration of architects, and to the subject of metropolitan improvements. He was delighted to find that there was such a general consensus of opinion in favour of his proposals. But at the same time he could not help observing that there was a small minority who, from perhaps an innate conservatism of the Charles Dickens type, still hugged on to the old state of things, and would not hesitate to sacrifice the great London improvement that was about to take place between Holborn and the Strand, with all its architectural and other possibilities—one of the finest of the generation—for the mere retention of "Ye Olde Curiositie Shoppe," just as it stood in Dickens's time, which lay in the way. Sentiment in such matters was, of course, very good in its way, but there was a possibility of carrying it too far. The advancing civilisation of our time demanded that such old rookeries and purlieus should be swept away and something nobler and better put in its place, if this London of ours was to take its proper position among the great capitals of the world. As well might such sentimentality try to dam back the advancing tide as to attempt to stop such necessary development. Time prevented his replying to all the notes, comments, criticisms and poetry with which his address had been honoured, but he would merely say that, so far as he in his humble capacity could judge of the gentlemen of Fleet Street, they might be conveniently divided between those who went so far as Brighton for their summer holiday and those who went beyond—say across the Channel. The latter, the great majority, he had no difficulty whatever in convincing that his criticisms on the London streets were justified when comparison was made with the great thoroughfares of the other great capitals of the world. These gentlemen had taken it well to heart, and were doing great public and patriotic service in pointing out London's shortcomings, with a view to their gradual rectification. But for the small minority who rarely ever left their dear old haunt between the bar and the bridge, it was only natural for them to suppose that Fleet Street was the real "hub of the universe," that the street itself was quite beyond improvement, that the "Cheshire Cheese" must remain in perpetuity, that the monument that marks the position of the old bar is a pattern to be followed as a work of art for the ages yet to come, that nothing could surpass in beauty the lovely railway bridge that spans the street at the foot of Ludgate Hill, or the size and picturesqueness of the lettering in the charming advertisements that intensify the architectural merits of the buildings forming the Circus. It would, indeed, be cruel to deprive such interesting souls—fossils might we call them?—of such pleasure as they can get out of such fetishes.

## ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

THE annual general meeting of this Institute was held in the offices, 20 Lincoln Place, Dublin, on the 19th inst. There was a good attendance.

Mr. G. C. Ashlin, R.H.A., the newly-elected president, on taking the chair, thanked the members for the honour they had conferred upon him in electing him to one of the highest positions in the gift of the Institute.

Sir Thomas Drew, past-president of the Institute, wrote regretting his inability to attend the meeting, and offering his congratulations to the newly-elected president on assuming office.

The President, in the course of an address, said that coming after the long and successful presidency of Sir Thomas Drew, during which the interests of the Institute were so much advanced, he thought that his task would not be an easy one, except he could rely on the consideration of the council. Continuing, he deprecated the practice which had sprung up of late among public companies, who had their headquarters in London, in employing English architects in erecting buildings in Dublin. He recognised the difficulties in connection with ecclesiastical work which were experienced in finding artificers here with the necessary equipment for carrying out the ideas of their clients, and, to improve the present condition of affairs, help had been promised by their public departments, and especially by the technical schools, and he thought that still further assistance might be given if prizes were offered at the Cork Exhibition for specimens of the work which were now in constant demand.

The secretary, Mr. W. Kaye Parry, read the annual report, which stated the satisfaction that has been felt at the inaugura-

tion of the Ulster Society of Architects, a body affiliated their own, and formed for the purpose of organising the architects of the northern province on the same lines as their own Institute. The report detailed the work done during the year and gave the terms of the resolution of condolence passed on the death of Queen Victoria. In consequence of the refusal of the Ennis Asylum Board, in the proposed competition for the extensive additional buildings, to appoint, as assessor, an architect who should have power to amend the faulty conditions, the competition, the Council advised the members of the Institute to abstain from taking part in the competition, and they were glad to say that the members loyally supported the action of the Council in this matter. During the year they lost no members through death, while, on the other hand, they had gained a considerable number of new members, the total now standing at 101.

Mr. J. Rawson Carroll proposed the adoption of the report and pointed out the benefits which the Institute had secured for the members during the past year.

Mr. William M. Mitchell, R.H.A., seconded the adoption of the report, which he considered to be an especially satisfactory one. He looked upon the formation of the new organisation in the north as very gratifying, and had no doubt that it would be attended with the most beneficial results.

Mr. W. Kaye Parry, in supporting the resolution, said the Council had decided to publish a little book giving an authorised list of architects' charges. This book would be of great advantage, and would be supplied at the small charge of 1s per dozen.

The report was adopted.

Mr. Batchelor, in the absence of Mr. Owen, presented the finance account, which showed that there was a balance of 66*l.* 5*s.* in hand.

The report was adopted.

The following were elected on the Council:—Sir Thomas Drew, Messrs. W. M. Mitchell, J. R. Carroll, C. Geoghegan, F. Batchelor, R. C. Orpen, H. Pentland, A. E. Murray, G. Sheridan.

This concluded the business of the meeting.

## GENERAL.

The Prince of Wales has accepted the Presidency of the Society of Arts, which was vacated by the King on his accession.

The Society of Architects, at a Council meeting held December 19, unanimously resolved, "That this Society is of opinion that it would be in the best interests of the public if architects, surveyors and engineers holding official appointments be debarred from private practice."

Mr. Henry Richard Yeoville Thomason, architect, has left property valued at 1,820*l.* 19*s.* 9*d.*

Negotiations involving over four millions sterling are nearly concluded for the purchase of the entire tramway system of Vienna by the municipality.

Sir Edward Poynter (president) and Mr. F. Eaton (secretary) had an audience of the King last Saturday, and submitted to His Majesty statements respecting the business of the Royal Academy.

Mr. John B. McDonald, R.S.A., died in Edinburgh last Friday at the age of seventy-three. He went to Edinburgh in 1852, where he attended the Board of Trustees' School of Art. Afterwards he studied under Robert Scott Lauder, and received several prizes from the Royal Scottish Academy.

The American Institute of Architects propose to organise a world's congress of architects during the Louisiana Purchase Exposition at St. Louis in 1903.

Sir Alexander R. Binnie, M.Inst.C.E., announces that in future his address will be 9 Great George Street, Westminster, S.W.

The Baker Street and Waterloo Railway Company will seek in the coming session of Parliament an extension of time until August 1905 within which to complete the line. The company also ask for new borrowing powers to the extent of 333,000*l.*

The Glasgow Exhibition authorities have ordered that the machinery hall and concert hall are not to be removed until express instructions to remove them, or either of them, are given, as the Corporation have not yet decided whether or not they will retain them.

The Work of Widening London Bridge will be commenced next month, but some slight alterations have been made recently in the general plan of improvement. The new footpath, which will be railed in with an open stone balustrade, will be quite independent of the main structure, except in the matter of support, and when completed the bridge will be 65 feet in width. During the alterations wheel traffic will not be interfered with in any way, and the erection of a temporary footway will insure the comfort of the pedestrian.

## THE

## Architect and Contract Reporter

## EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. All information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, Westminster.

**BATTERSEA.**—Jan. 31.—Premiums of 50*l.*, 25*l.* and 10*l.* respectively are offered for the three best sets of designs, &c., of dwellings, as follows:—(a) A house of two storeys; (b) a house consisting of two self-contained tenements; and (c) a house consisting of three self-contained tenements. Mr. W. Marcus Wilkins, town clerk, Municipal Buildings, Lavender Hill, S.W.

**GLASGOW.**—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

**HULL.**—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

**IRELAND.**—Jan. 20.—Plans, &c., are invited for drainage of Howth and Sutton, Dublin (and an alternative system for the latter). A premium of 50*l.* is offered. Mr. John O'Neill, clerk, board-room, North Brunswick Street, Dublin.

**ISLE OF WIGHT.**—Jan. 31.—Designs are invited for a suitable monument as a memorial to Her late Majesty, to be erected in St. James's Square, Newport, Isle of Wight. A premium of 25*l.* is offered for the accepted design. The Secretary, Isle of Wight Queen Victoria Memorial Committee, 20 Holyrood Street, Newport, Isle of Wight.

**KENT.**—Jan. 1.—Competitive designs are invited for laying-out about 16 acres of land, near Canterbury Road, Gillingham, as a recreation-ground. Premiums are offered of £20, £10 and £5. Mr. F. C. Boucher, clerk, Gardiner Street, New Brompton, Kent.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**SCOTLAND.**—Jan. 15.—The Kirkcaldy Burgh School Board invite competitive plans for a technical and science and art school to accommodate from 400 to 500 pupils, and an elementary school to accommodate about 400 pupils. Mr. Alexander Beveridge, clerk to the Board.

**WALES.**—Feb. 4.—Competitive designs are invited for municipal offices proposed to be erected by adapting, adding to and rearranging the town hall buildings at Mountain Ash. A premium of 75*l.* will be paid to the author of the design placed first in order of merit. Mr. H. P. Linton, clerk, Town Hall, Mountain Ash.

## CONTRACTS OPEN

**ASHTON-IN-MAKERFIELD.**—Jan. 8.—For supply of a steam road-roller, 12½ tons, a scarifier and a sludge and snow remover. Mr. J. W. Liversedge, surveyor, Council Offices, Ashton-in-Makerfield.

**BAKEWELL.**—Jan. 3.—For construction of a circular water-tight concrete reservoir to hold about 115,000 gallons, in the parish of Hassop, and the construction of a circular covered water-tight concrete service tank to hold about 50,000 gallons at the Headstones Head, in the parish of Ashford, and other works in connection with the proposed water-supply. Messrs. Sterling & Swann, engineers, Town Hall, Chapel-en-le-Frith.

**BARNSTAPLE.**—Jan. 16.—For supply and erection of the electric-lighting plant. Mr. W. H. Trentham, 39 Victoria Street, Westminster, S.W.

**BIRMINGHAM.**—Dec. 30.—For erection of pavilions, boiler-house and other works at the workhouse, Erdington. Messrs. C. Whitwell & Son, architects, Temple Row, Birmingham.

## SPECIAL VENTILATING GEARING FOR CELLS.

Can only be operated from outside, by the regulating movement, and cannot be tampered with inside the cell. Only one Ventilator is shown in illustration, but any number can be worked with the one movement.

**FRED VERITY & SON, CALL LANE, LEEDS.**

**WALES.**—Jan. 4.—For (1) widening the Hayes bridge, (2) widening of the North Road bridge, and (3) reconstruction of the East Wharf bridge, Cardiff. Mr. W. Harpur, borough engineer, Town Hall, Cardiff.

**WALES.**—Jan. 9.—For erection of a car dépôt at Newport Road, Roath. Mr. J. L. Wheatley, town clerk, Town Hall, Cardiff.

**WALES.**—Jan. 10.—For re-erecting the Crown Bridge over the canal at Sebastopol, near Griffithstown. Mr. D. J. Lougher, engineer, Pontypool.

**WALES.**—Jan. 13.—For erection of an infants' school, to accommodate 200 children, at Cwmcelyn, near Blaina, Mon, with out-offices, boundaries, playground, &c. Mr. R. L. Roberts, architect, Abercarn.

**WALES.**—Jan. 15.—For erection of a school at Alltwen. Mr. W. Watkin Williams, architect, 63 Wind Street, Swansea.

**WALSALL.**—Jan. 18.—For construction of a sewage tank 85 feet long by 21 feet 6 inches wide by 9 feet deep. Mr. John R. Cooper, town clerk, Borough Offices, Walsall.

**WEST HAM.**—Jan. 14.—For supply of four sets of surface-condensing plant, each to deal with 40,000 lbs. of steam per hour, complete with electrically-driven air and circulating pumps, and one travelling crane to carry 30 tons, span 67 feet. Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham.

MR. BORUP, of the Church Missionary Society, has sent home some interesting details of a church of brick which is being built under his direction by the Baganda. Fifty-six bricklayers are employed, most of whom have been trained since last year. They are, Mr. Borup reports, working willingly, and he does not think there will again be any difficulty in getting bricklayers in the country. The length of the church is 266 feet, the width is 50 feet. The roof will be thatched with grass. In addition to the bricklayers several hundred other workmen are engaged, and are receiving weekly wages.

THE rolling-mills department of the Moor Ironworks, Stockton, belonging to the South Durham Iron and Steel Co., Ltd., was laid idle on the 16th inst. by the strike of a number of men because of their objection to one of the chief rollers put over them by the firm. The management are not treating with the men, but have closed the whole of the rolling mills for the next six weeks or two months. They state they had decided to close the works early in the new year in order to lay down new rolling-plant, and that they will now proceed with the work. About 150 men are thrown out of work as a consequence.

**PLUMPTON.**

For repair and alterations to house and premises at Sedgebrook, Plumpton, Sussex. Mr. A. R. PANNETT, architect, Hayward's Heath.

W. WELLS, Plumpton (*accepted*) . . . £510 0 0

**W. HOFER & CO.**

At No. 25 Soho Square, one of the charming old mansions which aforetime abounded in the neighbourhood, but which are now daily giving place to more modern and pretentious but immeasurably less interesting examples of what a builder can do, Messrs. W. Höfer have artistically installed themselves; and here in the nobly proportioned rooms whose tapestried

walls serve to show them off to the best advantage may be seen an extensive array of ancient and modern art metalwork, including clocks and garnitures de cheminée, bronzes, panels, door furniture, grilles, handrails and balusters, hanging lamps, brackets, &c., for oil, gas and electricity, candelabra, &c.

While modern art is by no means neglected, and even some admirable if in some cases bizarre samples of the "new art" are shown, we think we are right in stating that the greater part of the specimens on view are wonderfully careful reproductions of the finest examples of old work, principally of the

best periods of French and German art. M. Höfer receives valuable assistance in his business from Mdme. Höfer, who evidently takes an artist's delight in the many beautiful things by which she is surrounded, and in expatiating on their manifold features of excellence or interest.

THE installation of the electric light in the York prison now in the hands of the military authorities is almost completed, and it is said that this will be the first prison so lighted. Messrs. A. J. Beaumont & Co., of York, have carried out the work from the city supply, and the installation comprises 375 lamps. Each cell is provided with a 5 candle-power lamp, 8 candle-power lamps are used in the corridors, whilst in the chapel and other larger parts of the building 16 candle-power lamps are put in. The chapel will have two brass electroliers, each with fifteen lights. In addition to the lighting, the prison has been fitted with electric bells and telephones.

# GERM-PROOF FILTERS

**Dr. ANDREW WILSON writes as follows:**—"The filters sold by the Berkefeld Filter Co. Limited, London, W., remove all germs from water. They therefore represent ideal filter giving pure (*i.e.* germless) water, and thus prevent typhoid fever and many other diseases."

**MOST EASILY CLEANED.**

**SIMPLE IN CONSTRUCTION.**

Water drawn direct from Filters attached to the service pipe, without interfering with the ordinary draw-off tap.

*Full particulars and Illustrated Price List on application.*

Architects are invited to see these Filters in operation at the Showrooms.

## INCORPORATED SOCIETY FOR PROMOTING THE ENLARGEMENT, BUILDING AND REPAIRING OF CHURCHES AND CHAPELS.

THIS Society held its usual monthly meeting on the 18th inst. at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. There were also present the Right Hon. J. G. Talbot, M.P.; the Revs. Canon J. Allen, D.D., A. G. Ingram and G. Miller; Lieut.-Col. the Hon. G. H. W. Windsor-Clive; Messrs. E. Lee-Warner, J. E. Ollivant, Basil E. Richardson, W. E. M. Tomlinson, M.P., and the Rev. W. B. L. Hopkins, secretary.

Grants of money were made in aid of the following objects, viz.:—Building new churches at Pockthorpe (Emmanuel) near Norwich, 70*l.*; St. Marylebone (St. Cyprian) Middlesex, 250*l.*; and Sandiway (St. John the Evangelist) near Northwich, Chester, 65*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Ashton (St. John the Evangelist) near Chudleigh, Devon, 25*l.*; Milford Haven (St. Catherine) Pembroke, 60*l.*; St. Columb Major (St. Columba) Cornwall, 35*l.*; Wembworthy (St. Michael) Devon, 15*l.*; and Radley (St. James) near Abingdon, Berks, 30*l.*, in lieu of former grant of 20*l.*

Grants were also made from the special mission buildings fund towards building mission churches at Preston (St. Matthias) near Brighton, 20*l.*; and West Bromwich (The Good Shepherd), Staffordshire, 25*l.*

The following grants were also paid for works completed:—Forest Gate (St. Edmund), Essex, 150*l.* on account of a grant of 250*l.*; Cardiff (St. Teilo), 300*l.*; Hoo (All Hallows), near Rochester, 10*l.*; Eastcombe mission church, near Stroud, Gloucestershire, 15*l.*; Churwell mission church, near Dewsbury, 25*l.*; Cowper Quay mission church, near Blyth,

Northumberland, 20*l.*; and Steelworks mission church, near Ebbw Vale, Monmouth, 20*l.* In addition to this the sum of 257*l.* was paid towards the repairs of twelve churches from trust funds held by the Society.

At the present season it cannot be out of place to call the especial attention of Church people to the valuable work undertaken by this Society, and to invite a larger and more substantial support in aid of its funds.

## SCARBOROUGH MASTER BUILDERS.

THE members of the Scarborough Master Builders' Association held their fourth annual dinner at the Albemarle Hotel, in that town, on the 14th inst., the president (Mr. A. W. Sinclair) being in the chair. There were forty members and friends present, including Councillor Mansfield, of York (president-elect of the Yorkshire Federation of Building Trade Employers), Councillor D. Maynard, Councillor Stephenson, Mr. A. Moore, Mr. R. H. Carr, hon. secretary, and others. An excellent menu was provided, which reflected the greatest credit on the manager, Mr. G. Thwaites. After dinner "The King" was proposed from the chair, the toast being received with musical honours. Mr. F. Horner gave "Our Trades," Mr. W. Malton responding. "The Master Builders' Association" was proposed by Mr. Moore, who dwelt at some length on the importance of such an association, and the President, in response, pointed out the work which had been done since the Scarborough Association was established. Mr. M. H. Fell then submitted "The Yorkshire Federation of Building Trade Employers," to which Councillor Mansfield (York), who is on Thursday to be elected President of the Federation, replied in a weighty and well-considered speech. Owing to the unavoidable absence of Councillor Bland, the toast of "The Architects and Surveyors" was proposed by Mr. Woodhouse, Mr. H. A. Chapman, A.R.I.B.A., responding. In a most humorous speech Mr. C. Peckit submitted "The Municipality and Borough and Trade of Scarborough," Councillors Maynard and Stephenson responding. "Our Guests" was proposed by Mr. H. Pickup, and replied to by Mr. E. Horsman and Mr. G. Cail. During the evening the Westborough Press Quartette (Messrs. Morley, Barrett, Judge and Ditchburn), Mr. T. B. Jowsey and Mr. E. Judge contributed vocal selections, which were greatly appreciated, Mr. R. H. Carr accompanying.

## VARIETIES.

THE parish church of Hacconby, South Lincolnshire, has been reopened after a thorough and much-needed restoration, at a cost of nearly 2,300*l*.

THE Ramsgate Town Council have decided to appoint Mr. E. B. Sharpley town clerk, the appointment to date from June next. Mr. Sharpley has been for some months assistant clerk to the Corporation.

THE new cottage-homes built by the Stoke-on-Trent Board of Guardians at Penkhill were formally opened on the 19th inst. by the Right Hon. Henry Chaplin, M.P., late President of the Local Government Board.

EXETER Cathedral's famous bells are being rehung for the Coronation at a cost of 1,400*l*. The great tenor—which is not called "Tom," like his confrères at Oxford, York and Lincoln, but "Peter"—is considered by expert campanologists to be the most melodious bell in existence.

THE new public room which has been erected at Threlkeld at a cost of over 500*l*. was formally opened on the 18th inst. The structure is of local stone covered with cement, and stands in the centre of the village. It is plain in form, but well suited for the purposes it will have to serve. These will include meeting-place for the Parish Council, friendly societies, reading and billiard-rooms, &c.

THE Westminster City Council having agreed to maintain the roadway after the widening of Piccadilly, London County Council workmen began to peg out the ground in the Green Park, from the Wellington Arch to Down Street, on Friday morning. The Chairman, the engineer and several members of the Council were present, and the Office of Works was represented by Colonel Wheatley, R.E.

At the monthly meeting of the Glasgow Archaeological Society, held at 207 Bath Street, a brief paper by Mr. John Bruce, F.S.A., was read, descriptive of the crannog recently discovered near Langbank Ferry, on the Clyde, and various articles found in course of the investigations were exhibited. Other papers submitted had reference to three carved slabs on Loch Lomond, and M'Ure's "History of Glasgow."

THE Edinburgh School Board have under consideration the applications for the post of architect to the Board, vacant through the death of Mr. Robert Wilson. There were sixteen candidates for the office, and they were reduced to the following five:—R. M. Cameron, 24 George Street, Edin-

burgh; A. Lorne Campbell, 44 Queen Street, Edinburgh; John A. Carfrae, 3 Queen Street, Edinburgh; Henry F. Keir, 36 Hanover Street, Edinburgh; and H. Ramsay Taylor, 7A Young Street, Edinburgh.

At a special meeting of the Bangor City Council Mr. Henry Lewis (mayor) presiding, the chief business was the appointment of a town clerk. The Mayor read a letter from Mr. Thornton Jones, a local solicitor, acknowledging the Council's intimation that the office was vacant, but stating that he had no intention of applying, as he considered the salary offered—150*l*—was wholly inadequate and sure to result in an early application for an increase, which was undesirable in every way. The Mayor then read applications from the other three applicants, viz. Messrs. J. A. Rodway, deputy town clerk, J. Glynne Jones, registrar of the County Court, and W. Huw Rowland, all solicitors of Bangor, the latter an ex-member of the Council who had resigned in order to become a candidate. Mr. Huw Rowland was elected by a final vote of eleven votes to eight.

THE tenth and last meeting of the session for 1901 of the Historic Society of Lancashire and Cheshire took place on the 19th inst., Mr. J. Paul Rylands presiding over the meeting. After the usual business Dr. J. W. Ellis delivered a lantern lecture on "The Mediæval Baptismal Fonts in the Hundred of West Derby and Wirral." Dr. Ellis commenced with a brief history of his subject, and put on the screen nearly forty views of the fonts dating from the Saxon to the sixteenth century, explaining the detail, devices and symbols of each. A long and interesting discussion took place, in which the chairman, Messrs. Peet, Price, Powell, May, Robinson and others took part, much new and interesting information being elicited. A vote of thanks, proposed by Mr. A. M. Robinson and seconded by Mr. W. F. Price, was heartily accorded to Dr. Ellis for his lecture.

A NEW market hall has been erected by the Bury (Lancashire) Corporation at a cost of 14,500*l*., and has now been formally opened by the mayor of the borough (Mr. J. Battersby). The hall is situated at the junction of Market Street and Moss Lane, and is designed to supersede an old market which has stood for over sixty years on an adjoining site. This old market has been a familiar object to two generations of Bury people. It was built in 1839 by the then Earl of Derby, and existed without a roof until 1867. The roof which was provided in that year has latterly threatened to become a danger

## THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE

### "PREMIER"

### SYSTEM of GLAZING.

Absolutely the most improved and complete method of

**WATERTIGHT GLAZING without PUTTY.**

**NO OUTSIDE PAINTING REQUIRED.**

**PERFECTLY DUSTPROOF.**

Wherever adopted saves 95 per cent. in maintenance.

**Curved Roofs can be Glazed with Straight Glass**

**SUITABLE FOR ALL KINDS OF ROOFING,**

Such as Weaving Sheds, Engineering Workshops, Railway Stations Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric Light Works, and Horticultural Buildings of every description

&c. &c.

(FULL SIZE.)

A—Zinc or Copper Cap.

B—Brass Bolt and Nut.

C—Asbestos Cord.

D—Steel Bar

This System allows for full expansion and contraction of glass and absorbs any vibration from machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

ESTIMATES AND DETAILED DRAWINGS SUPPLIED ON APPLICATION.

## IMPORTANT NOTICE

To Shipowners, Shipbuilders, Contractors, House Builders and Painters, and others.

The Products specified below are unrivalled, and have only just been introduced into this country.

**The "PERFECT" Universal Cleaner,** for removal of Old Paint and Varnish from Wood, Iron, Steel, or Stone. Magical in action. Guaranteed not to injure material, and new Paint or Varnish may be at once applied.

**PORPHYRINE.**—A Liquid for Dressing Walls of New Houses, to prevent Damp, and so that Paint or Paper may be put on at once, and for Removing Damp in Old Houses. This is a really wonderful preparation.

**FEROPHILE.**—A Liquid for Removal of Rust.

**"EXCELSIOR."**—A Paste for Prevention of Rust.

**W. GRANT, MARINE SURVEYOR, DOVER**

FOR ALL PARTICULARS AND PRICES APPLY TO

SOLE AGENT FOR UNITED KINGDOM.

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

to the stallholders and their customers. This fact, coupled with the necessity of providing further accommodation, led the Corporation to undertake the work of constructing a more modern and commodious building. The new market covers a superficial area of about 30,000 feet, and is so planned as to be capable of easy extension by the addition of bays to the south. There are provided 100 stalls, nineteen shops and five fish shops. The shops are placed round three sides of the building; at the Market Street side is the fish market, containing five large shops, and connected with the general market by swing doors. The central hall extends across the angle formed by the junction of Market Street and Moss Lane, and is approached by a wide central entrance and by two side entrances. Behind the hall is a covered space for the reception and storage of packages and cases belonging to the tenants. The interior walls are glazed to a height of 6 feet, and above this are of plastic brick. The roof is of iron construction, and is covered with varnished pitch-pine boards and Welsh slates. The fronts are Classic in character, and the central entrance, with its columns and heavily keyed arch, is surmounted by a large octagon dome. The hall is well lighted by intensified gas, which is understood to be more economical than the electric light.

### ELECTRIC NOTES.

A SPECIAL meeting of the Norwich Town Council was held on the 17th inst. to confirm the resolution of the Council in favour of applying for Parliamentary powers to purchase the Norwich Electric Lighting Company, Ltd. Mr. Alderman W. H. Dakin presided.

THE electricity generating station in Garden Square, Hebdon Bridge, is nearing completion. The site adjoins Hanging Royd Lane and the Hole-in-the-Corner public-house. In future no person is to be allowed to place any electric line above ground across any street in the borough without the consent in writing of the Corporation. Exceptions are made of the postal telegraph system, the National Telephone Company and the railway companies.

THE Glasgow and South-Western Railway Company have intimated to the Glasgow Corporation that they are prepared to enter into a special agreement to take a supply of current for St. Enoch station and certain other premises belonging to them within the city to an estimated extent of at least 660,000

units per annum for three years from June 1 last, and therefrom from year to year, until the agreement is terminated by either party on twelve months' previous notice, at 1½d. per unit. The electricity committee approve of this.

### BUILDING AND BUILDERS.

THE competitive designs submitted by Messrs. G. Baines & R. P. Baines, 5 Clement's Inn, Strand, W.C., for the Baptist church and schools, Blackhorse Road, Walthamstow, have been adopted. The accommodation provided in church is for 812 adults. The estimated cost, including tower, is 4,471/.

THE designs of Messrs. G. & R. P. Baines have been accepted for the new Congregational church, Bury Park, Luton, Beds. The estimated cost is 3,590/., inclusive of a bold tower. The seating accommodation is 533 adults. The facings are of red brick, and dressings of Bath stone.

OWING to the great increase in the population of Walney Island, it has been decided to enlarge the present church so that it will accommodate 600 persons. The cost is estimated at 5,000/., in addition to which 300/ is required for a new parish-room.

At a meeting of the Brownhills Urban District Council on the 18th inst., Mr. J. Poxon presiding, the surveyor reported the completion of the plans of the proposed bacteria beds at the sewage farm, and he hoped to put the work in hand shortly.

THE Wolverhampton Town Council have accepted the tender of Messrs. H. Wilcock & Co. for the proposed alterations and additions to the Town Hall, its amount being 14,550/., and it is estimated that additional work for panelling the Council chamber, &c., will cost about 1,375/.

THE public health committee of St. Pancras have received a communication from the Local Government Board, stating that they have now sealed the order sanctioning, with certain conditions and modifications, the schemes made under Part II. of the Housing of the Working Classes Act, 1890, known as the Brantome Place and Prospect Terrace Improvement Schemes. Copies of the order will be forthwith served upon the owners or occupiers of the land and tenements affected.

AT Dunfermline last week a meeting of the committee charged with the erection of the new baths and gymnasium was held. The architect (Mr. Hippolyte J. Blanc) was present,

### THE MAY-OATWAY FIRE ALARM

Licensed by H.M. Postmaster-General.

No greater fire loss than £10 has ever happened in any building protected by this system, and no one has ever been injured or lost. Whether the premises are occupied or not it is impossible for any fire to burn for more than a few seconds without giving its own alarm, and that at a period early enough to insure its suppression by half a dozen buckets of water. Approved by every Tariff Insurance Office and Fire Brigade in New Zealand, and solely used by the Government of that Colony for the protection of national property where the lives of inmates are concerned.

and submitted final plans and sections. Some dissatisfaction was expressed at the delay which had occurred, and it was hoped that good progress would be made as soon as the weather permitted. The architect stated that the schedules for the tradesmen were now completed, and it was resolved to advertise for estimates for the various works.

LORD BEAUCHAMP, presiding at a meeting held at Malvern in furtherance of the scheme for erecting in Worcestershire a sanatorium where consumptives may be treated by the new open-air system, said it behoved them to see what could be done to stay the ravages of this most terrible of diseases. The success that had attended sanatoria in Germany and other places abroad, as well as in some of our counties, justified the belief that a like sanatorium would be of great service in that county, and he would be glad to give it his support. Dr. Braine Hartnell, principal of the sanatorium on the Cotswold Hills, read an exhaustive paper upon the subject, following which Dr. Dixey made a statement with regard to what was proposed. The sanatorium would provide for forty-eight beds at a cost of 12,500*l.*, and patients would pay from 25*s.* to 30*s.* per week.

At a meeting of the Edinburgh and District Lunacy Board, Mr. Richard Clark presiding, the Clerk gave a report as to the expenditure on and position of the works with regard to Bangour Asylum, and a report by the Lunacy Board on the present plans. From this it appeared that the total amount paid to date was 85,674*l.* 19*s.* 10*d.* Further, it appeared that the total approximate estimate of the asylum for 600 patients was 263,230*l.*, and for 1,000, 376,840*l.* Included in this total was a sum of 16,600*l.* for architects' fees, and 10,000*l.* for measurers' fees, &c. Attached to the report was a memorandum by the Medical Commissioners on the plans of the asylum. This memorandum stated that it appeared to the Commissioners that the plans showed throughout unnecessary costliness in matters of detail. Instances of this were too numerous to be individually specified, but examples were given, such as mullioned windows, crow-stepped gables, string-courses, expensive mouldings and stone balustrades serving no purpose. These seemed out of place in the buildings of a village asylum erected for poor people, and would add nothing to their efficiency as a means of caring for or curing the insane. Special attention was directed to the question of whether such buildings as the homes and supervision homes (of which there would be many) could not be so planned as to provide all the necessary accommodation at less cost. The various depart-

ments were criticised individually, and in dealing with the home for thirty-six quiet, chronic or industrial patients (estimated to cost 6,470*l.*, or 180*l.* per bed), the Commissioners said it was to be regretted that the home for patients who needed the simplest arrangements for their care and comfort should be so expensive. Mr. Currie moved and Mr. Williamson seconded that no more expenditure be incurred until the Board had fully considered the statement now submitted. After considerable discussion it was resolved to convene a special meeting to discuss the report next week.

MAJOR C. E. NORTON, R.E., held on the 19th inst. an inquiry at Wolverhampton into the application of the Town Council for sanction to borrow 5,232*l.* for the provision of houses for the working classes. The town clerk said the Corporation had provisionally purchased 4,000 square yards of land for 550*l.*, and it was proposed to erect fifty cottage tenements at an estimated cost of 4,682*l.* Since the latter amount had been decided upon the Local Government Board had suggested several alterations and additions which would involve a supplementary estimate, and would doubtless have the effect of slightly increasing the rentals unless the Local Government extended the period for the repayment of the loan. The site was considered to be suitable; it was near manufactories, was in easy distance of the town and in measurable distance of the new tramway system. It was anticipated that there would not be any charge upon the rates in respect of the particular movement. The Corporation did not propose to enter into competition with builders, and the scheme was meant for the accommodation of persons who were cleared away from slum property. Mr. George Green (borough engineer) gave evidence in support of the scheme, which met with considerable opposition. It was, however, supported by the Mayor, and on his motion a vote of thanks was accorded the inspector, who expressed his intention of visiting that afternoon any property fit or unfit for human habitation that might be shown him.

#### TRADE NOTES.

THE White Oak Schools, Swanley, are being ventilated by means of Shorlands' patent concealed exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

**Orders must reach us by December 28.**

GUARANTEED CIRCULATION OF **20,000** COPIES

**The Architect and Contract Reporter**

**NEW YEAR'S SPECIAL ISSUE. 67th Volume.**

6 to 11 Imperial Buildings, Ludgate Circus,

London, E.C.: December 1901.

DEAR SIR,—On Friday, January 3 next, **Twenty Thousand (20,000) Copies** of "**The Architect and Contract Reporter**" will be sent to ARCHITECTS, BUILDERS and CONTRACTORS throughout the United Kingdom, America and the Colonies, and to the Clerks and Surveyors of Local Boards and Corporations.

"**The Architect**" is, in its Advertisement Columns, the most reliable reference for all who are engaged in Building Operations, and is acknowledged to be **the BEST medium for Advertisers**. The List of Prices will prove that the expense of a Page Advertisement in this issue would amount to less than **one-fourth the cost** of sending **20,000 Circulars** by post, and it is well known that Circulars are frequently thrown into the waste basket unread. Our New Year's Double Number always contains beautiful illustrations and valuable letter-press, and is consequently well studied and kept for reference.

The earliest positions will be allotted to first applicants, so that if you wish to secure space for an Advertisement, we shall be much obliged if you will do so without delay. For many years past we have had to leave out Advertisements which have reached us after the limited number of pages have been filled.

We are, Dear Sir, yours faithfully,

GILBERT WOOD & CO, LIMITED.

THE Farnley Iron Company, Ltd., have obtained in the Chancery Division an injunction against Messrs. Warrington & Son, of Stoke-on-Trent, restraining the latter firm from printing and publishing any catalogues, &c., containing any plates, or illustrations, or tabulated lists of bricks copied from or being a colourable imitation of those in the plaintiffs' book called "Farnley Price List: Glazed Brick Section." Mr. Manby, for the defendants, said his clients had undoubtedly copied the catalogue unwittingly, and they submitted to the injunction.

MR. CHARLES D. PHILLIPS, M.I.M.E., of Emlyn Works, Newport, Mon., has issued a very attractive little brochure entitled, "Where the Emlyn Specialties come from," containing an interesting and copiously illustrated descriptive account of his extensive works. The views, of which there are about thirty, are from photographs, and, being excellently reproduced, convey an admirably clear conception of the amount of space and costly machinery required to successfully carry on Mr. Phillips's important business.

### WELSBACH INCANDESCENT COMPANY.

IT looks as though the directors of the Welsbach Incandescent Gaslight Company are in for some troublous times. The report of the advisory committee appointed many months ago to inquire into the affairs of the company, is on the point of issue, and it appears that it entirely confirms all the reasonable criticisms that have been passed upon the company. It is, in fact, a stinging report, recommending changes of the most drastic nature. After discussing the formation of the company, the committee state that it has been enormously over-capitalised, and that the properties transferred were transferred at a grossly exaggerated value. They are of opinion that the real responsibility for the excessive over-capitalisation of the company must be shared in a great measure by the original board of the Welsbach Company, and more especially by the chairman, who occupied a position of financial repute, and was naturally regarded as the sponsor for the value of the properties which the company acquired. After pointing out that the directors had better means of gauging the value of the properties than the public, and without desiring to say anything that might unduly cast the whole onus of blame on any one person or group of persons, the committee find "that the undue inflation of capital has been one of the contributing causes of the difficulties into which the company has fallen." In the matter of

the reduction and readjustment of capital, this, it appears, did not fall within the terms of the reference to the committee, and they do not, therefore, submit any definite proposals in the present report, but they suggest that in any definite plan of reorganisation there should be provision for additional working capital, and urge that that should be one of the earliest duties of the board of management. It is a well-known fact that an undue amount of money has been spent in patent litigation, and upon this point the committee urge that the costly litigation should be speedily brought to a close. "The benefit to the company," say the committee, "has not been commensurate with this large expenditure." Regarding the commercial policy of the company and the reduction in the price of burners, the committee are of opinion that this is undoubtedly a step in the right direction, and they go further and express the belief that it will be necessary "to revise the present unbusinesslike selling arrangements in certain important respects." It is desirable, say the committee, that a general manager should be appointed. The purchase of the Kern burner for 80,000*l.* in cash is regarded as "rash and hazardous in the extreme," seeing that it was "for a hitherto untried patent." The committee are unable to find any reasonable ground for the purchase of the Sunlight Company. It is alleged by the Hon Philip Stanhope and his colleagues that the accounts have been badly kept in the past, and that in some instances pluralised salaries are enjoyed by the officials of the company in respect of different duties, and that in many cases the duties of officials overlap. "In almost every department there is room for far-reaching economy and increased efficiency." Regarding the board of management, "in view of past dissensions and errors, the present board," say the committee, "are incapable of conducting the affairs of the company with success," and it is recommended that all the members of the present board be called upon to retire and a new board of five appointed."

### HOUSE-BREAKING IN NEW YORK.

"Buildings," coolly answered the witness.

The building wrecking business is a comparatively new one in New York, and is the direct outgrowth of the extensive architectural improvements which have transformed the city of New York in the last two decades. When a piece of property is purchased nowadays for the purpose of erecting on it a new business building or apartment house the owner is usually anxious to have the plot cleared for the builder, and in most instances even the foundations are taken out, so that new and more massive masonry may be constructed. It was the custom before the days of the wrecking concerns to give the builder the contract to take down the old structure on the site on which the new one was to be erected, and while some of the material was saved the greater part of it was carted away as fuel, junk or rubbish. The wrecking concerns to whom the demolition of buildings is now entrusted know the value of old building material, and usually find a market for the heaps of débris which look valueless to the layman.

"One must be an all around mechanic, a builder and a judge of values," said a man who makes his living by tearing down buildings, "to be a successful wrecker. It's nothing to pull down a house and save the big pieces, such as stone steps, sills and lintels, carved mantelpieces and inside fittings. That was enough in the days when there was no competition, but nowadays we must save every foot of pipe, the ordinary wood-work and even the nails out of the floors to get even on close bargains."

Much of the material which comes from the wrecked buildings is sold on the spot and carted away by the purchasers, but large quantities of all kinds of building material are stored in yards where they are easy of access when the customer who wants ready-made doorsteps or well-seasoned bricks may come to buy. Sheds are provided for the storage of doors, counters, wainscoting, window frames, flooring and trim, and racks and bins contain iron and lead pipe, gas and water fixtures, and nearly every item in the line of builders' hardware.

One of the largest wrecking contracts of the year is the one which is now under way on the block bounded by Fifty-first and Fifty-second Streets and Park and Madison avenues. The building which is being demolished was until recently occupied as a Roman Catholic orphan asylum. The concern having charge of the demolition of the building gave a round sum for the privilege, and agreed to have the block cleared in fifty working days. The Madison Avenue front shows that the work of destruction is progressing rapidly, but one must go

into the court, behind the scenes, to get an idea of the work that is being done. There one sees great piles of all kinds of building material, which at first glance appear to be piled indiscriminately into shapeless stacks. On closer inspection one sees, however, that the flooring has a place for itself, that doors, sashes, columns, beams and other parts of the vanishing structure have places set aside for their temporary storage; that men are at work cleaning the brick and stones, and that waggons are taking away great quantities of metal from the east side of the enclosure, where men weigh the bent and twisted pieces that have outlived their usefulness and are valuable now only as junk.

One of the wreckers, when asked whether the amount paid for the old building would be realised from the wreckage, said, "It would be a bad job if we did not get that back. In addition to what we paid for the building it will cost us more than 15,000 dols. to take it down, and although the work has just begun, we are already getting much of our money back. The rapid transit people bought all the timber. We get 11 dols. a ton for the junk iron, 4 cents a pound for the lead and 13 cents a pound for copper. Bricks are worth 7 dols. a thousand, and as the bricks from a building like this are as good as new, we have no difficulty in realising 3 dols. 75 cents and 4 dols. for them, cleaned and delivered. This building contains about six million bricks. Of this amount about one million will be lost in breakage and count, but even then at 3 dols. 75 cents a thousand we would realise 18,750 dols. on the one item of bricks."

Among the persons employed on the work there are, in addition to the unskilled labourers, "bar men," who work on high places displacing the stones to be preserved; carpenters, gas and steam fitters and plumbers. On some contracts portable elevators are put in the buildings, in which the material is lowered to the ground, but a more popular method is to take up a part of the floor on each storey and chute the material. This process is being employed on the orphan asylum work.

The man who buys "old things" regardless of what they are or where they come from is a good customer of the wreckers. He buys mantelpieces and doors, for which he usually has no use, and stores them in lofts and back yards, in order to have them when he builds a new house—some day. Many persons called at the orphan asylum when the work of demolition began and asked for pieces of wood from the chapel, and the cross which stood on the roof was sold to a

priest who had been connected with the institution. There have been many inquiries as to the corner-stone, and a neat sum awaits the wrecker for that relic when he finds it.

### WOODEN PAVEMENTS IN PARIS AND LONDON.\*

THE history of wooden pavements abroad is a long one, and within the limits of this paper can only be briefly treated. The two most important cities abroad being London and Paris, perhaps we may as well confine ourselves to those points, although many other cities in England and on the Continent, as well as in Australia, use wood in large quantities. In Germany, however, wood is not so popular as elsewhere on the Continent. In Paris the wooden blocks are all manufactured and laid by the city authorities, the various plants having a capacity of 47,000 blocks per day, or about 1,000 square yards. These blocks are of two depths, 15 centimetres or about 6 inches for the softer varieties of wood, and 10 centimetres or about 4 inches for the harder woods. The amount of wooden paving in that city is somewhat over one and one-half million square yards. The woods used have about the following relative wear:—1, teak; 2, karri; 3, pitch-pine; 4, native pines. The last are generally used.

The traffic on the principal streets is enormous. On the Rue de Rivoli it is over 65,000 teams per day, or 3,400 per yard of width, and over 66,000 teams per day on the Avenue de la Opéra, or about 2,000 per yard of width. Fifth Avenue, as counted for the Barber Asphalte Company some few years ago, showed 8,400 teams per day, and Madison Avenue 7,000, about one-eighth of the Paris traffic. Under this traffic the native woods wear on the average 1 centimetre or 0.4 inch per year, and are allowed to wear down until 10 centimetres of the total depth of 15 centimetres have been worn off. They are then removed. This gives under the heaviest traffic in the world, with inferior woods, a life of ten years. The horses are not allowed to have calks on their shoes, which probably makes the wear a little less severe than in this country, but this is counterbalanced many times by the enormously greater volume of the traffic. On the other hand, the absence of the calks proves that the pavements are not slippery, an argument which is sometimes advanced against wood pavement.

\* Extracts from a paper by Mr. F. A. Kummer, read before the American Society of Municipal Improvements.

It may possibly be said that the wear above noted per year is considerable, although taken in connection with the volume of traffic this is not so. In Paris it is found that the rate of wear under the heaviest traffic for wood, namely, one centimetre per year, is exactly the same as the rate of wear for granite throughout the entire city.

In constructing the streets in Paris the concrete is brought to a true surface by floating it with a grout composed of Portland cement and fine sand. No sand cushion is used. The blocks are laid directly on the smooth concrete surface, and are laid perpendicular to the line of the kerb. Laths, afterwards removed, are introduced between the blocks, making a joint of about  $\frac{3}{8}$  inch, which is grouted with sand and Portland cement. About twelve days suffice to complete any particular portion of a street, from the date of closing it to the date of opening it again to traffic.

Owing to the fact that soft woods are generally used in Paris, the surface of the wood is to some extent spongy, and the practice of spreading a thin layer of sand and fine gravel over the streets every few days is followed, the gravel being crushed and ground into the fibre of the wood, giving the roadway a sandy surface. This, of course, reduces the slipperiness of the pavement. In London, however, this is not frequently done.

Labour employed by the Paris city authorities costs from 80 to 90 cents per day, and the completed pavements cost for wood about 3.10 dols., for granite about 3.40 dols., and for asphalt about 3.12 dols.

A large proportion of the woods used in Paris are treated, creosote being generally employed, but a large quantity of the preservative is not used, generally from 8 to 10 lbs. per cubic foot.

In London there was laid from 1874 to 1884 about 1,000,000 square yards of wood. There is now about four times as much in that city. The earlier pavements were untreated wood, generally Swedish deal, a wood of fairly good quality. Later it was "pickled," as they call it, by dipping in hot creosote oil after thorough seasoning. About ten years ago the Australian woods, karri and jarrah, came into favour, but are not now generally regarded as being so satisfactory as creosoted deal, and pavements laid with them are being taken up and replaced with creosoted Swedish deal. Most of the pavements now being laid consist of Swedish deal on concrete, either creosoted under pressure or dipped, although untreated wood is used in some sections. The Swedish deal used in

REGENT SQUARE, GRAY'S INN ROAD, W.C.

London weighs from 3,500 to 3,600 lbs. per 1,000 feet B. M., while our best long-leaf Georgia pine weighs about 900 or 1,000 lbs. more per 1,000 feet, or 4,500 lbs. per 1,000 feet. It is therefore a much harder and more durable wood, having a crushing resistance along the line of the grain greater than that of oak.

Wood on concrete has been used for paving in London for some twenty-seven years, its use having been begun about 1874, although the first London wooden pavements were laid in 1839. The average life, of course, depends upon the nature and volume of the traffic. In the Kensington district, where they use principally creosoted Swedish yellow deal, the average life of the pavement throughout the district is shown by the following extract from the forty-fourth annual report of the surveyor of the parish of St. Mary Abbots, Kensington, for 1900:—

"Kensington High Street was paved with dipped blocks laid by the Improved Wood Paving Company in November 1891, under their maintenance contract, which was then expiring. These dipped blocks had, therefore, lasted a little under eight years. The wood creosoted under pressure had lasted in the other roads about twelve years, with the exception of the section of Kensington Road marked (c), which had been down 9½ years. The wood was not worn out, but it had been very much cut up and damaged by the operations of the National Telephone Company, and as the consequent reparation would have involved the making good of a considerable proportion of the entire area, it was deemed advisable to repave the whole surface, and thus prevent the necessity of twice interfering with the traffic on this important road."

It should always be borne in mind that figures for wear are entirely relative. The traffic over the streets in London is very heavy, far heavier than on the streets of any of our largest cities, and the constant and very heavy omnibus traffic is particularly damaging to the pavements. Therefore the same class of street pavement in this country would beyond question have a much longer life. If, further, we can lay a class of timber much harder and better able to resist wear than the Swedish deal, and add to this a treatment that will make the wood still harder and completely waterproof, we should under lighter traffic at least succeed in obtaining double the life obtained on the heavily travelled streets of London, or say 24 years.

A section of long-leaf Georgia pine, known abroad as pitch-pine, 756 square yards in area, was laid with cement joints on

King's Road, London, some years ago. On the same road were laid sections of plain and creosoted deal, about the same time. The annual wear in the case of the plain deal averaged in depth during five years 0.139 inch, as against 0.055 of an inch for the pitch (Georgia) pine, or about two and one-half times as great. In the case of the creosoted deal on the same street, the average depth of wear was 0.111, or about twice that of the pitch-pine. The results of the trial of pitch-pine, as summarised in a paper read before the Institute of Civil Engineers in 1883, were to the effect that "practically the plain pitch-pine pavement is cheaper than yellow deal, and the ascertained vertical wear promises admirable results." The use of yellow pine, however, in London, in spite of this opinion, has not extended because of the great cost of the best qualities of lumber delivered there.

The dimensions of the blocks used in London are almost invariably 3 by 9 inches on the wearing surface, and 4 to 5 inches in depth. The blocks are often worn in some places to little more than an inch in depth before being removed. Such excessive wear would only be secured in the case of pitch-pine in a period approximately two and one-half times as great as that required for equal wear with the Swedish deal.

With regard to a guarantee for maintenance, the conditions of contract vary in every district. In some districts the authorities employ their own labour, and in such cases the timber merchant simply supplies the blocks under the inspection of the surveyor of the district, and their liability ends with the delivery of the blocks. In other districts, where the work is contracted for in its entirety, the contractor has to supply and lay the wood-paving to the satisfaction of the surveyor, and his liability ends as soon as the work is completed. In other districts the practice is for the contractor to keep the roadway in perfect condition for a given period, varying from six months to three or more years, either free or at a price per year included in the original bid. Prices thus vary considerably. Throughout the district of Kensington 43,476 square yards of pavement laid during the year ending March 1900, all creosoted deal, part 4 and part 5 inches in depth, cost an average price of about 2.25 dols. per square yard. This embraces no cost for maintenance.

With reference to creosoted blocks, the report of Mr. Weaver, surveyor, Kensington district, quoted above, says:—"The superiority of creosoted blocks over plain wood is demonstrated by the fact that creosoted 5-inch blocks in High Street, Notting Hill, and Fulham Road, lasted twelve years,

whereas the previous paving, consisting of 6-inch plain deal blocks, lasted less than nine years under much lighter traffic."

The renewals are made necessary generally by the traffic at the principal points of stoppage for omnibuses, for instance, where the continuous heavy pounding of the horses when starting necessarily wears the pavement away at that one spot more rapidly than at other parts of the street.

Wooden pavements abroad are often sprinkled with sand, as before mentioned, to reduce the tendency to slip. Soft wood blocks, especially those creosoted, have a rather slimy surface, making them probably more slippery when wet than harder blocks having a surface unaffected by moisture. Also there are no calks on the horses' shoes, which renders such sprinkling more necessary. It is an advantage that wood pavements may be so sprinkled and slipping thereby reduced. Asphalte, more slippery than wood in the start, cannot be so sprinkled without injury to its surface.

It has been claimed, against the use of wooden blocks particularly when untreated, that some of the blocks are softer than others and more porous, and consequently wear more quickly; but this is remedied by the treatment of the block especially where the mixture of creosote and rosin, called the creo-resinate process, is adopted, owing to the fact that the softer and more porous blocks take up just that much more of the preservative and hardening mixture, and are therefore all brought to the same degree of resistance. At the same time, where only heart wood is used, with no sap whatever, the difference in density of the wood is very small.

### LOUISIANA PURCHASE EXPOSITION.

THE Louisiana Purchase Exposition in St. Louis in 1903 will be the first in which hills enter into the composition of the main exposition "picture." The natural topography of the site, says the *Engineering Record*, prompted this radical departure. This main picture is to be located entirely within Forest Park, the second largest public park in the United States. The use of the unfinished half of the park was granted to the exposition company by the city as an exposition site. This part contains a level tract of about 400 acres, which formerly supplied space for golf links and a race track. From this level the ground rises on a slope of about 60 degrees to an average height of 60 feet. The main exhibit buildings, the big

towers, the lagoons, basins, canals and statuary groups occupy the lower level. The Art Gallery and its by-buildings, the architectural chef d'œuvre of the exposition, designed by Mr. Cass Gilbert, and the United States Government Building, designed by Mr. J. Knox Taylor, are to be built on the elevated tract. In the treatment of the intervening slope the commission of architects had scope for originality. The difference of elevation constituted the chief problem with which they had to contend. They solved it by means of hanging gardens and a series of cascades.

The main picture of the exposition is roughly in the shape of a gigantic fan, the ribs of which are the avenues of the exposition. At the apex of this composition stands the Art Building on an eminence. Three great cascades, that issue from the sides of three hills in the form of a crescent, are to course down the hillsides and empty into a large basin. The water effects of the picture, radiating from these three cascades, offer a mile of continuous water circuit. From the roughly semicircular basin into which the cascades plunge, two streams in imitation of a natural river branch to right and left. As they traverse the avenues their banks assume a regular geometrical outline to their debouchure into the grand basin at its lower end. The beautifully wooded areas on the highest levels of Forest Park are to be occupied by the State and foreign buildings.

### TRADE CONCILIATION COURTS IN NEW ZEALAND.

THE main features of the Industrial Conciliation and Arbitration Act now in force in New Zealand are as follows:—

Any society, whether of employers or workmen, may register, under conditions which are fully set forth in the Act, and which are too long to repeat here.

Provision is made to prevent the needless multiplication of unions, and the effect of registration renders the union which is registered and all persons who are members of it subject to the jurisdiction of the Court appointed by the Act.

The Act appoints a Board of Conciliation, consisting of an unequal number of persons, who are elected by the registered unions for a period of three years.

The country is cut up into districts, each of which has a Board, and no member may sit on more than one Board.

When a dispute arises between employers and workmen, it

may be referred for settlement to the District Board, who must carefully and expeditiously inquire into the dispute, and has power to summon witnesses and administer oaths. The Board may make what suggestions it deems right for inducing the parties to come to a fair and amicable settlement of the dispute, and may adjourn the proceedings to allow the parties to agree upon some terms of settlement, or it may refer the dispute to a committee of its members, consisting of an equal number of the representatives of employers and workers, with a view to facilitating and promoting an amicable settlement of the dispute, and if a settlement is arrived at, it shall be set forth in an industrial agreement which shall be executed by the parties and filed with the Board. If no industrial agreement is arrived at, the Board may make a recommendation for the settlement of the dispute, and upon receipt of the Board's recommendation all parties to the dispute may have free access to it, and if they accept the Board's recommendation they may bind it by an industrial agreement, but if the Conciliation Board is unable to bring the parties together, the matter is referred to the Court of Arbitration, which is one Court appointed for the whole colony for the settlement of industrial disputes. The Court consists of three members appointed by the Governor, one being appointed on the recommendation of the employers' unions, and the other on the recommendation of the workmen's unions, the third member being a judge of the Supreme Court, and he is president of the Court. The members of the Court hold office for three years.

If a dispute goes to the Arbitration Court from the Conciliation Board the parties may appear personally or by agent, and may produce all the evidence they think proper.

There are elaborate provisions for insuring the proper hearing of all disputes, and the decision of a majority of the members of the Court is the decision of the Court.

The Court has power to dismiss frivolous cases, to award costs, and to decide generally upon all questions of dispute between employers and workmen who belong to the unions. The Court has to frame its award in such a way as to best express its decision, avoiding all technicalities, and the award has to specify all the persons on whom it is binding, being in every case each industrial union or employer who is party to the proceedings at the time when the award is made. It must also specify the industry to which it applies and the industrial district to which it relates, as well as the currency of the award, which, however, cannot exceed three years from its date.

The award of the Court of Arbitration must also state in clear terms what is or is not to be done by each party on whom the award is binding, or by the workers affected by the award, and may provide for an alternative course to be taken by any party.

The award once made then extends to every industrial union or employer who is at any time, whilst the award is in force, connected with or engaged in the industry to which the award applies, within the industrial district affected, and the Court has power to amend its own award for the purpose of remedying any defect in it, and to extend the award so as to join and bind as party to it any specified industrial union or employer in the colony not theretofore bound by it, but connected with or engaged in the industry affected, and all these powers are exercisable upon the application of either party bound by the award.

The Court in its award, or by order afterwards made, may determine what shall constitute a breach of the award, and what sum, not exceeding 500*l.*, shall be the maximum penalty payable by any party who contravenes it, and the Court may also, at any time whilst the award is in force, prescribe a minimum rate of wages, with special provision for a lower rate being fixed in the case of any worker who is unable to earn the prescribed minimum.

For the purpose of enforcing the Court's decision, elaborate provisions are made, which compel all persons to obey the award under various penalties, which are all provided by the law.

The Court has full and exclusive jurisdiction to deal with all offences.

The general provisions of the Act go on to provide that an industrial dispute shall not be referred to a conciliation board, nor shall any application be made to the arbitration court for the enforcement of any industrial agreement or award, unless such a step be authorised by a resolution passed at a special meeting of the union and confirmed by subsequent ballot of the members, and this is to be done at a special meeting.

Either the board of conciliation or the court of arbitration has power to direct that two experts nominated by the parties shall sit as experts, and in that case they become assessors.

The Act brings the Government railways under its operation, and provides that the Amalgamated Society of Railway Servants shall be deemed to be an industrial union registered under the Act, so that railway servants are given the full benefits of the Act.
